have prevented the assumption of the title chemist and druggist by companies, and this clause has now been so modified that these companies can continue to practise as they have done in the past, provided they have in their employment a duly registered pharmaceutical chemist. A further amendment was also adopted by which the Bill was extended to Ireland. The Bill as amended came up for third reading yesterday, and will then go to the Lower House. The pharmaceutical corporations interested in the matter still hope that there the original clause will be restored, possibly with a further proviso that it shall not come into force for a term of seven years. The fate of the Bill in the Upper House was naturally a subject largely referred to at the annual dinner of the Pharmaceutical Society, and we are glad to see that the President of the General Medical Council and the President of the Royal College of Surgeons voiced the opinion of the medical profession in condemning with no uncertain voice the change which had been made. As Dr. MacAlister pointed out, the case for reform was unanswerable, since the state of the law, as it now exists, made illegal for a single person what was permissible when performed by seven men united to form a company. Further, as the President of the Pharmaceutical Society said, a company of unqualified persons would be under no obligation to make up prescriptions in accordance with the British Pharmacopœia, nor would it be incumbent upon them to keep strong poisons in accordance with the poisons regulations which are obligatory on registered chemists. We can only reiterate the hope of the Society that the House of Commons will restore this much-needed clause to the Bill.

San Francisco Doctors.

THE solidarity of the profession of medicine is illustrated very forcibly by an appeal that has just been issued by a committee appointed by the New York Academy of Medicine, the Medical Society of the County of New York, and of the County of Richmond for help in money and kind for the doctors of San Francisco. It is estimated that some five hundred medical men were ruined by the earthquake, and though their services are badly needed by the survivors, these latter being themselves mostly penniless are unable to pay fees. Moreover, the doctors are severely handicapped by lack of apparatus, instruments, and books, and special stress is laid on this point by the committee, who urge that those who are unable to contribute in the form of money will surely be able to spare something in the way of instruments or books. Thoroughly in accordance with the altruistic spirit of the appeal is the announcement that though all gifts will be acknowledged by the treasurer, no list of contributors will be published. It is to be hoped that a prompt and generous response will be made, and of that there can be little doubt, as a local appeal made by the King's County Relief Committee for Physicians

brought in \$1,200 in a few days. The present occasion offers a unique opportunity for American medical men to show that though it is necessary to earn fees in order to live, the practice of medicine has higher aims and greater opportunities than those of accumulating money.

Sweated Industries.

THE conditions and remuneration of labour are factors which lie close at the heart of all questions of public health; indeed, public health would present but few problems if all people were well housed, well fed, well paid, and well cared for. As it is, hygiene is bound up so intimately with social questions that it becomes practically a branch of sociology. For this reason medical men must look with a sympathetic eye at the Exhibition of Sweated Industries which, organised by the *Daily News* and carried out by a special Executive Committee, is now open to inspection. The revelations which that exhibition brings into relief are such as may well make a civilised country blush. Many of those who live in comfortable houses and eat good dinners are accustomed to look upon the burden of Tom Hood's "Song of the Shirt" as being as obsolete as the Curfew Bell or the Dodo. To such it may come as a shock to learn that 7d. a dozen is paid for "making up" shirts, a task which takes a woman six hours' work, and involves the finding of her own thread, and that the process known as "shirt finishing" is paid at a rate which enables the finisher to make from 12s. to 14s. a week if she works seventeen hours a day. Factory legislation has ensured to those who labour in large buildings a proportion of the amenities of life not inconsistent with human existence, and surely it is time that the Government took account of the condition under which home-labour is carried out. Doubtless the difficulties of control will be much greater, but such exposures as those of the Sweated Industries Exhibition turn one's eyes involuntarily from the "servile conditions of labour" in South Africa to the practical slavery at our own backdoors.

The Government and Experiments on Animals.

THE intention of the Government to appoint a Royal Commission to inquire into the subject of experiments on animals was announced last week by the Home Secretary in answer to a question by Sir Philip Magnus. As stated by Mr. Gladstone, it is now some thirty years since an inquiry was held, and we are quite in agreement with him that it is time further inquiry were made. Everyone in any way acquainted with the subject is aware how seriously scientific experiment is hindered in these countries by the irritation of the present restrictions, and the wonder is that England does not lag further behind Continental countries in scientific research. It is a matter of the utmost importance to science, and particularly to the sciences ancillary to medicine, that the views of responsible authorities should be impressed on the forthcoming Royal Commission. There is no

doubt that the "anti-vivisectionists" will seize the opportunity to impress their views on the Commission and the public, and if care be not taken there is some chance that, instead of gaining the exemption science requires, further restrictions may be imposed. The representation of the views of the medical profession on a matter which vitally concerns the future of medical science would naturally fall to the British Medical Association, if that body be not too busy in its search for a Royal Charter to pay attention to other matters.

Professional Neglect.

In view of an impending appeal we refrained at the time from commenting on some extraordinary passages in the charge of Lord Chief Baron Pallett to a County Antrim jury in the case of *Tughan v. Darnell*. It will be remembered that the action was taken to recover from Dr. Darnell, a medical man practising at Bangor, damages for injury resulting from the application of belladonna liniment. We understand that the intended appeal has been abandoned, so that we are no longer bound to silence. To put it briefly, the Lord Chief Baron has given an entirely new and stronger meaning to the "reasonable care, prudence, and foresight" a medical man is presumed to bring to the performance of his professional duties. "Coming," he said "to the usage and practice of the profession, he desired to give the jury a distinct direction upon that which was all-important in the case. The use and practice of the profession was evidence, but not conclusive evidence, in favour of the defendant on the question of reasonable care, prudence, and foresight. But if the defendant had omitted any precaution or warning which they might consider reasonably ought to have been given to guard the patient against the risk which, as a skilled physician, he ought reasonably to foresee and against which he could reasonably have guarded him, no usage of the profession could protect him from liability from the reasonable consequences of such omission. That was the law." As a matter of fact, Dr. Darnell had used all the precautions commonly adopted by medical men in regard to the treatment ordered, though some of the medical witnesses admitted that, in view of the knowledge brought to light in this case for the first time, they would think stricter precautions advisable in the future. The result of the Chief Baron's direction is that a medical man is responsible not merely for what is considered reasonable in advance by his colleagues—the only people competent to judge, but for what after the event a jury may consider reasonable. Undoubtedly the usage and custom of a profession were evidence for the consideration of the jury in favour of the defendant upon the question whether he used due care or not if he showed that he used the usual care; but the issue was to be determined not by the usage of the profession, as proved by expert witnesses, but was to be determined by that grand old tribunal, our refuge in all cases of importance—the opinion of twelve honest and experienced men.

PERSONAL.

THE Prince of Wales has been pleased to appoint Sir Richard Havelock Charles, K.C.V.O., M.D., to be a Physician in Ordinary to His Royal Highness.

PRINCESS CHRISTIAN presided, on the 14th inst., at a meeting of the special appeal fund of the National Committee for the Establishment of Sanatoria for Workers Suffering from Tuberculosis.

DR. NORMAN MOORE, F.R.C.P.Lond., Physician to St. Bartholomew's Hospital, has been re-elected for a further term of five years Representative of the Royal College of Physicians of London on the General Medical Council.

DR. JAMES W. B. HODSDON, F.R.C.S.Ed., Senior Assistant Surgeon to the Edinburgh Royal Infirmary, has been elected Representative of the Royal College of Surgeons, Edinburgh, on the General Medical Council.

THE Bathgate medal, which was founded by Colonel William L. Bathgate, in memory of his father, Mr. McPhune Bathgate, F.R.C.S.Ed., Lecturer on Materia Medica in the Extra Academical School, has been awarded to Mr. James H. Johnston, of Edinburgh.

MR. CHARLES A. BALLANCE, F.R.C.S., Surgeon to St. Thomas's Hospital, the National Hospital for Paralysis, and the Hospital for Sick Children, has been elected President of the Medical Society of London for the year ensuing.

DR. J. J. O'HARE has been presented with a valuable hunting watch, on the occasion of the conclusion of his term of office as Assistant Master of the Hoiles Street Maternity Hospital, Dublin.

DR. A. ROCHE has been appointed interim assistant physician to the National Lying-In Hospital, Dublin, in succession to Dr. O'Hare, whose term of office has just expired.

THE PRESIDENT, Mr. McArdle, the Chairman of Council, the Honorary Secretary, Sir W. Smyly, P.R.C.P., Sir Arthur Chance, P.R.C.S., Professor Kinkead, Sir W. Whitla, Professor Corby, Dr. Kidd, and Dr. Greene have been appointed as a deputation from the Irish Medical Association to wait on the Chief Secretary for Ireland in reference to the grievances of Poor-law medical officers.

SIR WM. MACEWAN, F.R.C.S., Regius Professor of Surgery in the University of Glasgow, has promised to deliver the Cavendish Lecture before the West London Medico-Chirurgical Society in the Town Hall, Kensington, on the evening of Friday, June 8th. The subject of the lecture will be "Some Points on the Surgery of the Lung."

THE Corporation of McGill University, Montreal, have resolved to confer the honorary degree of Doctor of Laws on Dr. Donald MacAlister, President of the General Medical Council.

THE honorary degree of Doctor of Civil Law has been conferred with much enthusiasm, at a special convocation of Durham University, on Baron Takaki. The Baron was drawn in a carriage from the railway station to the Castle Hall by a number of students.

GENERAL regret will be felt at the announcement of the intention of Professor McKendrick to retire at the end of the present session from the Chair of Physiology in Glasgow University.

THE twenty-sixth annual dinner of the British Dental Association was held at the Hotel Cecil last night, under the presidency of Mr. Leonard Matheson.

A CLINICAL LECTURE

ON

MALIGNANT DISEASE OF THE LUNGS.

By JAMES ALEXANDER LINDSAY, M.D., F.R.C.P.Lond.,

Professor of Medicine, Queen's College, Belfast; Physician to the Royal Victoria Hospital, Belfast.

GENTLEMEN,—Malignant disease of the lungs, though not extremely rare, is a sufficiently uncommon condition to make its diagnosis a matter of more than ordinary interest. In the earlier stages of the affection the diagnosis involves considerable difficulty, the physical signs being variable within wide limits, while the symptoms are not always characteristic. An affirmative diagnosis being synonymous with a death sentence, the practitioner is naturally reluctant to suggest the possibility of pulmonary malignancy; but, on the other hand, the possibility is one which for obvious reasons should be faced as promptly as possible, in order that we may be saved from holding out futile hopes or persisting in abortive treatment.

I have notes of seven cases of malignant disease of the lungs. In four of these cases the diagnosis was verified at the autopsy. In the remaining three cases the diagnosis was certain in two and highly probable in the third. I propose to give the results of my observations under the following heads:—

- (a) Previous history of the case.
- (b) Symptoms.
- (c) Physical signs.
- (d) Nature of the growth.
- (e) Duration of the case.

(a) *Previous History*.—This is a point of the first importance and often gives us the earliest clue to diagnosis. In the great majority of cases of pulmonary malignancy, the growth is secondary to tumour elsewhere. In two of my cases there had been excision of the mamma for scirrhus, in one case six weeks, in the other two years, before the advent of pulmonary symptoms. In a third case the patient had had his leg amputated for sarcoma, five years before coming under my observation, and in two other cases the disease began in the glands of the mediastinum. In the remaining two cases of the series of seven, no primary growth could be discovered, but it must remain a matter of doubt whether the disease really originated in the lungs, as this is well known to be rare.

We may take it as a point of the first importance to get a clue to a previous growth in a case where the symptoms and physical signs suggest the possibility of pulmonary malignancy.

(b) *Symptoms*.—As a rule, it is the symptoms which first attract attention and which give us the greatest help in forming a diagnosis. Persistent thoracic pain, gradually increasing dyspnoea, and cough were present in all my cases. This symptom-complex is highly suspicious in a patient who has had a growth elsewhere than in the lungs, above all, if the probability of aneurysm can be excluded. The prominence of pain and the increasing urgency of the dyspnoea are specially important, because these symptoms are, upon the whole, improbable in the conditions—e.g.,

tuberculosis of the lungs—most likely to be confused with malignant disease of the lungs.

Hæmoptysis was present in five of my cases, absent in two. Some authorities believe that the hæmorrhage often has a red-currant jelly-like appearance; others (e.g., Stokes) describe it as dark and mucoid. My own experience would lead me to doubt the validity of these rules. In several of my cases the hæmoptysis was not superficially distinguishable from that of phthisis. In one case the hæmorrhage was copious and uncontrollable. Pyrexia was also present in five out of my seven cases, and did not differ decisively from the pyrexia of pulmonary tuberculosis. Night sweating was prominent in two out of my seven cases, and emaciation was marked in four. Pulmonary malignancy may progress so rapidly that there is hardly time for much emaciation. In the last case which has come under my notice the patient remained plump and well-nourished until near the end. It is fallacious, therefore, to exclude malignant disease of the lungs because there is little or no definite cachexia.

(c) *Physical Signs*.—These are extremely variable and not at all to be relied upon in the earlier stages of the affection, while at an advanced stage they become pronounced and easily interpreted.

In one of my cases, the disease first showed itself by rhonchi and mucous râles in the right mammary region, which were suspicious from their localisation, from the fact that the lady in question had had the right mamma removed six weeks previously for scirrhus, and because tuberculosis was on various grounds improbable.

Râles of various kinds may occur in these cases; a pleuritic rub is not uncommon; but when the growth has become well-developed we generally get the following group of signs:—

Dulness in percussion, usually very pronounced.

Weak breathing.

Diminished vocal fremitus.

This group of signs suggests not only that a growth may be present, but that it is compressing one of the main bronchi. The localisation of these signs presents many variations and no definite rules are possible, but we may say that malignant growth in the lung is relatively common in the middle regions of the lungs, that it very rarely attacks the apices, and that it never exhibits those laws of more or less definite dissemination which are so frequently observed in pulmonary tuberculosis. Bulging of the ribs and sternum is frequent in pulmonary malignancy, but it is a late symptom.

In addition to the physical signs directly due to the presence of a tumour, it is common in malignant disease of the lungs to get the ordinary signs of pleural effusion at the base posteriorly. The effusion is often, but not always, hæmorrhagic in character. Some observers think the effusion is much oftener serous than blood-stained.

(d) *Nature of the Growth.*—Of the four of my cases where an autopsy was obtained one belonged to each of the following varieties of malignant growth, viz., encephaloid carcinoma, lymphosarcoma, squamous-celled carcinoma, while in the fourth case the nature of the growth was doubtful.

(e) *Duration of the Case.*—The following was the duration in the various cases: Case 1, four months; Case 2, eight months; Case 3, three months; Case 4, five months; Case 5, four months; Case 6, doubtful, but brief; Case 7, doubtful, but prolonged.

The above cases, few in number though they are, suggest the following observations:—

The history is a matter of the first importance in investigating any suspected case of pulmonary malignancy. Fortunately, from the nature of the case, the history is usually obvious and easily ascertained. We must beware of what is, perhaps, a somewhat natural error, viz., of too confidently diagnosing a growth in the lung in the presence of certain signs and symptoms because the history seems to make the existence of such a growth probable.

The symptoms are fairly consistent, and, on the whole, to be relied on, especially in the later stages of the affection, but at the outset they may be vague and inconclusive. The prominence of pain in the chest with oppression of the breathing is very significant in any case in which, on other grounds, the presence of a pulmonary new growth might be suspected. Aortic disease, which might give rise to similar symptoms, can usually be excluded without difficulty. Aneurysm may cause more difficulty, but here the patient's age, sex, occupation and habits, the history of syphilis, which is frequent in aneurysm, and the presence of vascular degeneration will assist in arriving at a correct diagnosis.

In several of my cases the presence of hæmoptysis, pyrexia, night-sweating and emaciation made the simulation of phthisis for a time close. In any case of doubt between pulmonary malignancy and phthisis, the following rules will be found helpful:—

1. The history of the two types of case is different. In phthisis we shall probably get a history of vague ill-health with debility and loss of weight; in pulmonary malignancy we shall probably get a history of removal of the mamma, or of operations upon bones, uterus, or rectum.

2. The age of the patient may present some contrasts in the two cases, though this rule is not to be definitely relied upon. Phthisis is more likely to occur in adolescents, pulmonary malignancy in middle life or later. The average age of my seven cases was 42; only one was under 30; two were over 60.

3. The progress of pulmonary malignancy is usually more rapid than that of phthisis; there are no remissions of symptoms or periods of rally and amendment, which are so common in phthisis.

4. The sputum should be frequently examined. The characters of the sputum in pulmonary malignancy are variable, and must be interpreted with caution. The detection of tubercle bacilli would, of course, at once settle the diagnosis.

5. Pain and dyspnoea are much more prominent in tumour of the lung than in phthisis, and much less under the influence of palliative measures.

6. Displacement of the heart would point

strongly to tumour, unless pleural effusion is present.

As to the duration of cases of pulmonary malignancy, Walshe gives the average duration as 13½ months. Osler thinks that from six to eight months is more probable, and my statistics would tend to confirm this view. It is, of course, difficult and often impossible to determine the actual beginnings of the invasion of the lung in these cases.

In some cases the history, signs, and symptoms point irresistibly to the presence of an intrathoracic malignant growth, but it is difficult to say whether its seat is mediastinal, pleural, or pulmonary. A careful analysis of the early symptoms may give some assistance in determining this point, but in not a few cases the differential diagnosis is for a time, at least, impossible. Early hæmoptysis would point to a pulmonary seat of the tumour, while late hæmoptysis would possess less significance. The physical signs might serve to differentiate these conditions, e.g., if the earliest physical signs were those of infiltration, rather than of compression, of the lung substance.

In one of my cases, the presence of malignant nodules upon the abdominal wall gave an important clue to the diagnosis. In any doubtful case, the search for evidence of malignant disease elsewhere in the body is, of course, a point of the highest importance.

It is important to remember that malignant disease of the lungs, as of malignant disease in any organ, may for a time be almost latent. The clinical picture of malignancy usually present to our minds is essentially a picture of the advanced, or at least the fully-developed, disease. We can not too carefully remember that malignant disease of the lungs may for a time be practically without symptoms; that pain, dyspnoea, and cough may be absent; and that the patient may retain a full measure of nutrition, until the case is far advanced.

The treatment of malignant tumour of the lungs gives little scope for therapeutic measures. The relief of pain may be effected by some of the usual measures. For the relief of dyspnoea, hypodermic doses of strychnine and inhalations of oxygen are of some value. Hæmoptysis is not usually excessive, but may be very intractable.

NOTE.—A Clinical Lecture by a well-known teacher appears in each number of the journal. The lecture in next week's number will be by Geo. A. Gibson, M.D., F.R.C.P., Sc.D., LL.D., Physician to the Royal Infirmary, Edinburgh, Examiner in Medicine, Oxford University, Examiner in Clinical Medicine, Edinburgh University, on "Persistent Ductus Arteriosus" (delivered in the Edinburgh Royal Infirmary).

ORIGINAL PAPERS.

SIMPLE TUMOURS, AND THEIR RELATION TO MALIGNANT DISEASE.*

BY W. H. CLAYTON GREENE, M.B., B.C. CANTAB., F.R.C.S. ENG.

Surgeon in charge of Out-Patients to St. Mary's Hospital, Paddington; Surgeon to the French Hospital in London.

We have been accustomed for a long time to divide our new growths into two classes—simple and malignant—by means of a hypothetical border line, but we have not as yet been able satisfactorily to ascertain those

* Read before the Harvelian Society, April 29, 1906.

factors which lead to the transgression of this imperceptible barrier and which institute a malignant change.

During the last few years the limelight of experimental research has been turned upon the various forms of malignant disease, and although we have undoubtedly learned many important details with regard to their structure and method of growth, we are still in the dark as to their causation.

While this prominent position has been occupied by tumours which are undoubtedly malignant, those growths which are still classified as simple have been left in obscurity, and we ourselves, content with text-book dicta, have come to regard them as of slight importance, unlikely in most cases to influence the life of their unfortunate possessor in an adverse manner.

It is somewhat surprising that so little attention has been directed to this subject, and how little the relationship between these simple and malignant forms of growth has been appreciated.

A few lines are found at the end of a text-book account to suggest that a malignant degeneration may occur, but no emphasis is laid on the fact that in a surprisingly large number of cases, where undoubted malignant disease is present, it has been preceded by some local tumour formation.

How often in cases of cancer of the breast do we obtain the history, "Oh, I had a small swelling there for a number of years, but I didn't think much of it!"

From a brief survey—and at present I cannot boast an experience worthy of any other adjective—I would venture to formulate three axioms with respect to simple tumours.

(1) That every simple tumour is an expression of tissue instability.

(2) That any so-called simple tumour is potentially malignant.

(3) That irritation is an important factor, not only in producing many forms of simple neoplasm, but in exciting them to transgress that arbitrary line of definition which separates them from malignant growths.

During the development of the body we find that from certain areas following ancestral laws, certain tracts of tissue, certain glandular or muscular territories, are formed; but how is it that these organs, so laid down, keep narrowly within their proper limits. Take, for example, the thyroid gland—an organ which is budded off from two distinct regions, into a sustentacular bed of embryonic connective tissue, to be fused, metamorphosed, and finally encapsuled off from the surrounding structures by the limiting action of the developmental process.

What power limits that process? Is it the nervous system? We have no proof. Is it that the cells of the gland impose restriction on their own growth? Is it because of some poor connective tissue capsule? The only factor which can influence the extent of the growth of an organ is the restraining action of surrounding structures, the mutual limiting action which different organs of the body exercise on one another. This is a wonderful mechanism over which we have no control, and about which we are still entirely ignorant. If this adaptive arrangement is interfered with, we meet examples of irregularities of growth in the detachment of certain organs from their normal position, or in the aggrandisement of one particular part, usually at the expense of another.

Consider for a moment the supra-renal capsules. These glands, complex in their development, are associated during their period of active growth with three surrounding organs—the liver, the kidney, and the testis—on the posterior abdominal wall. Under ordinary conditions a mutual defensive policy is established, whereby each zone of developing tissue is narrowly confined within its own appropriate sphere of action; but if the contract is not rigidly carried out, if the equilibrium is upset, what is the result? The wandering terminals of the embryonic supra-renal penetrate into the still undefined regions of the liver, the kidney,

or the testis, and remain there isolated from their parent gland, often springing into activity at a later date.

It is unnecessary to multiply examples. I have selected the above illustration, firstly, because it amply emphasises my point; secondly, because attention has recently been directed to the group of tumours springing from misplaced adrenals, to which I hope to refer later.

Now, it may be asked, What bearing has this on the subject under discussion? Well, I have touched on this aspect of development because it comes closely into relationship with the genesis of tumours. Not only during the active period of intra-uterine life are unseen forces skilfully concealed, influencing the rate and range of cellular activity, but after the fœtus has been discharged from the shelter of the maternal uterus, active growth and cellular reproduction is continued, and so long as the heart pumps blood new cells are being formed to take the place of those worn out in the wear and tear of functional metabolism. In other words constant reproduction is going on, governed and restrained by the same unknown forces that are at work in the fœtus. Look, for instance, at the sebaceous glands of the skin, where the casting off of the central cells in the one and the superficial cells in the other is, in the process of secretion, immediately made good by a young and active generation.

Just as in the embryonic cells of the fœtus there is an infinite capacity for reproduction, so in the case of the more developed being the same power is present, though less actively expressed, and the same influence which determines the limits that shall confine the fetal gland acts in restraining the reproduction of the adult cell.

What, then, is this modifying influence? If we can discover it we shall, I think, go a long way towards the discovery of the cause of cancer. At present I take it that by virtue of a state—which, for want of a better term, we will call, with Ribbert, "mutual tissue tension"—the various cells of a part are restrained from pursuing a policy of aggression; it may be that the nervous system exercises some influence, but that at least is one of the points which we have yet to investigate.

Turning to the pathology of the simple tumours, we find that they illustrate a departure from the natural conditions of a part by the over-activity of certain cells which enter into their composition.

The standard definition of simple tumours is that they grow slowly, possess a capsule, do not recur if completely removed, and do not infiltrate. Such a definition is insufficient, inaccurate, and misleading. The rate of growth varies and may equal that of a malignant neoplasm; the capsule is a fortuitous occurrence, depending upon the position of the tumour. Some do not possess it; while, on the other hand, a sarcoma or even a carcinoma in their early stages may possess a capsule defined enough to satisfy the most exacting critic. They do not recur if they are completely removed; nor, we may add, do malignant tumours; but in the latter case the obstacles to complete extirpation are more insuperable. Again, the fact that certain of these so-called innocent growths are dangerous to life from their position—papillomata of the bladder, or of the larynx—that many of them tend to ulceration, sloughing and decomposition, apart from other considerations, strongly suggests that we should reconstruct our views and definitions with regard to this group.

If we study the histology of these simple tumours we always find one or two elements in excess of the normal, either connective tissue or epithelium, or both. Now in the natural condition of the body, as I have suggested, an equilibrium is established, not only between different organs, but between the individual cells of an organ; and the presence of abnormal numbers of connective tissue or epithelium cells points at once to a disturbance of the controlling forces, and is, in fact, a condition of tissue instability.

And so, turning to my first proposition, I put it to you that the presence of any simple tumour, whether connective tissue or epithelium, is an expression of ill-ordered reproduction beyond that which is required in the ordinary economy of the body; it is an indication that the tissues in this situation lack that mutual balance, upon the careful adjustment of which the various cells of the body live in harmony with one another.

Every simple tumour is potentially malignant.—Such a statement is, I know, a sweeping one, but I believe that this is the attitude that we must adopt towards them. There is no form of simple tumour which cannot be held up as an example of subsequent malignant change, and there are sufficient illustrations to show that this potentiality is often expressed. The very presence of a simple tumour of any kind is, as I have urged, an indication of tissue instability; it shows that in this situation the tissue control is deficient; it is, in fact, a note of warning that our tissue tension is unduly strained; and while I am ready to admit that in the majority of cases this power of malignant alteration is never called into activity, I would insist that the power and tendency is there. If we study sections of the various forms of the adenomata, we shall be able clearly to define certain types.

(1) Fibro-adenoma, where the fibrous tissue is mature, and the whole process slow and quiet. All active irritative phenomena have subsided, and we have nothing but the stage of proliferation or new growth.

(2) The adenoma—where the epithelium is active, the stroma slender and not expressed. The appearances here suggest a greater activity of growth, a more energetic cell reproduction, as distinguished from the first.

From these two main forms we pass gradually to tumours, where the activity of the epithelium or connective tissue is so pronounced as to make us hesitate in declaring on the side of innocence. It seems to be a question of rate of growth, and we may take a series of tumours of the breast, and say—Such and such a one is innocent, such and such a one is malignant; but we cannot define the narrow limit which separates the two. *Facilis est descensus Averni.* It is an easy and gradual transition from the innocent fibro-adenoma to the carcinoma or sarcoma.

Now this short paper is the outcome of two cases which impressed me very deeply, and although I can relate a large number of cases where a simple condition has been replaced by a malignant one, these two will suffice.

(1) A., woman, æt. 35, who was admitted with a swelling, apparently a fibroma, over the left shoulder. It had been present for a number of years, but recently it had increased in size and had become painful. Removal was freely performed, and the microscope shows an old fibroma, a ring of leucocytes, and a periphery of sarcoma. The growth recurred within six months. I have no further notes.

(2) An old man, who had always (from birth) had a tumour on the right side. Six months before I saw him it became painful, and increased in size, and finally ulcerated. I saw it in the latter part of last year, told him its nature, and removed it freely. The microscope tells us that this is a spindle-celled sarcoma.

In our research as to the causation of tumours, we must, I think, take two stages; first, to consider those factors that are at work which enable the cells of a part to abnormally multiply while still confined within the narrow limits of an organ, and which in this manner constitute a tumour by no means so simple as its name implies; and secondly, those additional influences which enable the cells of that part, either with or without a previous stage of local development, to pass beyond all physiological boundaries and invade the body generally. It is an open question whether the same factors are present in both instances; personally I think they are, though it is possible that the cancer cell is endowed with some peculiar attribute which

the cell of the simple tumour does not possess. At any moment, however, it may acquire this attribute, and simple tumours, since they are early expressions of disordered reproduction, are especially favourable subjects for the acquirement of this power.

As to the origin of these simple tumours, I am whole-minded in the opinion that they arise—either, according to Cohnheim, from eccentricities in the germ cells of the part, as in the case of the adrenal rests, or as the result of a definite or circumscribed irritation. There are, I know, a number of objections which can be urged against these theories, but I would plead that there are two points strongly in their favour:—

(1) The absence of any tenable theory to take their place.

(2) The result of microscopic investigation.

With regard to this latter point let us consider some of the various histological phases of the fibromata and the fibro-adenomata. The fibroma, a connective tissue tumour, cannot be formed in mature fibrous tissue. The fibrous cell is the completed fibroblast, which itself has passed through a round cell stage. No fibrous tissue is ever laid down in the body without a previous period of round celled activity, and such round-celled activity is co-existent either with a condition of inflammation or with a phase in the development of embryonic connective tissue. Leaving out of account those conditions which are the result of irregular development, we may assume that in all these fibrous or connective tissue tumours a preliminary stage occurred, when certain changes compatible with a low form of inflammation were present, before the tumour could be completed in its final fibrous stage, and it is surely reasonable to argue therefore that some local irritative cause was responsible for its production. The fibrous epulis is never found without the carious tooth; the mucous polyp represents a retrogressive change in the connective tissue, and is always preceded by a hypertrophic inflammation of the nasal mucous membrane. And we have many instances where a local inflammatory condition leads to the development of an increase of fat, as for example around the kidney, and I believe that a Lipoma is a variety of connective tissue response to some local stimulus similar to the fibroma, but differing, as in the case of the polyp, in the form of its expression.

Where two elements are concerned in this abnormal reproductive process, epithelium and connective tissue, we shall find a varying amount of each, according to the activity of their response. If the connective tissue is the more affected while the epithelium remains at rest, a fibro-adenoma with a preponderance of fibrous tissue will be the result; but let the stimulus affect the epithelium and we shall find tumours with active acini and slender stroma, there being usually a tendency on the part of the epithelium to undergo a cystic change.

If sections of a chronically inflamed breast are studied a striking resemblance is at once noticed between their histological characters and those of the adenomata, and the only distinctions which it has been possible to draw are that the adenomata possess a capsule, in the inflamed breast the cells are round and appear more active, while the general features of the inflammatory changes are more pronounced.

What of these differences? The capsule, I argue, is purely fortuitous and due to the peculiarly limited area of the breast affected, the process in most cases being confined by a natural boundary of hyaline connective tissue, rich in nuclei, which surround each breast acinus, and which, under the influence of the stimulation, proliferates at the periphery of the active zone.

I have here a specimen, taken from a local tumour of the breast, which does not possess any such capsule; and yet it is clear from its microscopical appearance that an active inflammatory process is not at work. It in fact represents an adenomatous growth, where the connective tissue is especially vigorous, and in this instance the process has not been checked by the usual barrier of connective tissue at the margin of the area.

It is the missing link between these tumours, which possess a distinct surrounding capsule, and the cases of diffuse inflammatory changes in the breast, where the same phenomena in the main are present, but there is no attempt at limitation. The presence of spindle in the place of the round cells only points to a more mature stage of the pathological process.

Now it may be urged that it is a curious phenomenon, and somewhat at variance with my theories, that while inflammatory exudates tend to disappear, these tumours, if indeed they are the outcome of inflammation, still persist. I would ask whether in those cases where inflammatory changes have been pronounced all evidence of the struggle is completely removed? In fact, it would be no idle statement to say that where there have been very extensive disturbances brought about in a part as the result of inflammation some remains can always be found. But I admit that this alone is not a satisfactory explanation of the differences between the ordinary inflammatory residues and simple tumours, and I think that the true cause lies in the fact that, in some manner that we do not yet understand, the irritation, or the conditions that have led to the appearance of the tumour, has so upset the normal equilibrium between the individual cells that there is not a great attempt on the part of the tissues to revert to their original state.

I have already alluded to a relation which seems to exist between simple and malignant tumours, and I wish to discuss briefly some of the various theories which have been expounded as to the origin of this latter group. It is a convenient and a reasonable view to regard all new growths as infections, strictly comparable to an infection by bacteria; only in this instance the infecting agent is an epithelial or connective tissue-cell. Owing to the conditions under which they develop, these cells become parasites. I do not imply for one moment that they are foreign to the body and are implanted on it from outside, but that the very cells which should be normally performing natural functions have become perverted in their actions and pathogenic.

The pathology of the injurious action of one class of cells over another has been widely studied, and we know that there is a distinct antagonism between various cells of the organism, and we know also that a certain degree of parasitic action occurs in some of the blood cells. Now we may compare the simple tumour with an infection of low virulence; the whole process is localised, as for example in a circumscribed tubercular nodule, and there is no tendency while in this stage for the infection to proceed further. In cancer, on the other hand, the cell activity is much more marked; the cell infection spreads readily along the various anatomical paths and attacks the tissues of the body in a more general manner, being comparable in this form with a spreading bacterial infection of some virulence.

The points which have to be closely considered are whether this difference between these two types of growth is due to intrinsic or extrinsic factors; that is, do cancers depend upon some modified condition of the tissues themselves, such as a lowering of individual resistance to a cell infection, or to the advent of some agent from without? It is of course characteristic of malignant growths that their cells transgress the limiting basement membrane, but we cannot for a moment suppose that this membrane alone is responsible for the security of the part. We realise that there is a vast variety in the manner in which different patients respond to the cancer infection, so that the individual resistance has a good deal to say in the matter. But at the same time it is probable that the cells which go to form a malignant tumour are endowed with some special property, in virtue of which they exercise their peculiar influence. According to one authority it is the advent of the leucocyte which, in conjunction with an epithelial cell, forms a partnership for the production of cancerous change; and it is interesting to notice that in the specimen of the

fibroma which is showing malignant transformation the zone of leucocytes around the fibrous tissue is exceedingly well marked.

It is said that the union of the epithelial cell and the leucocyte renders the cell capable of reproduction in a peculiar manner, comparable to the more active reproduction of the ovum after fertilisation by the spermatozoon; and when this fusion has taken place the arrangement of the filaments of the nuclear network occurring in cancer cells is like that which is found during early development, and is quite different from that which occurs normally in the body, and what factor, other than some irritation, can stimulate the blood vessels to pour out leucocytes round the cells of a part?

Doyen has grown a cancer coccus, and it must be admitted, on the evidence of independent observers, such as Metchnikoff, that this organism is undoubtedly present, and it may be that this is the factor that we are in search of, which determines malignant transformation. At present there is no proof of this. Doyen's own hypothesis that the cancer cells are proliferated in order to repel the invasion of the tissues by this micro-organism is surely incorrect. If this suggestion were right, it would be difficult to explain why cells from the rectum have to wander away to lymph glands and liver in order to deal with organisms which have reached those situations where there are plenty of cells ready to do their duty. If his theory is correct, this form of inflammatory reaction is entirely foreign to our accepted ideas and shows fundamental difference from all the cardinal features of inflammation elsewhere.

We are unfortunately at present not in a position to decide which, if any, of these various theories is sound, but we are in a position to consider that the growth of cells in malignant disease is a more pronounced expression of irregular proliferation and tissue instability, which are the characters of the simple tumours, and that certain important factors, which influence the development of the innocent, have undoubtedly a share in the malignant. I would venture to suggest that the more thorough investigation of the life history of simple tumours will have some bearing upon the discovery of the cause of cancerous change, and the idea that all new growths are cell infections will in the meantime form a satisfactory working basis.

The particular form that malignant disease assumes is a matter of chance. Those agencies which excite abnormal proliferation of epithelium and connective tissue in simple tumours act in a similar manner in malignant disease. If the connective tissue responds the more actively to the stimulus a sarcoma is formed, but if, on the other hand, the epithelium is roused to action, a carcinoma. I believe, however, that there is often a tendency to the production of both forms of the growth, but that in the end one or other preponderates. (See *Lancet* March 31st, 1906, Pp. 921-922.)

The group of tumours which grow from the misplaced adrenals is especially interesting, obviously arising from some imperfection in the germ areas, and we can recognise three distinct types of response to the various stimuli. First, there is the local tumour occurring in the kidney, the testis, the liver, or the cord—in fact, in any region remotely connected with the developing adrenal, a form which remains quiescent, showing no tendency to grow, the so-called adenoma.

Secondly, there is a more active form where cellular reproduction takes place, and where infiltration and destruction of the surrounding tissues occurs without any metastatic growths. Thirdly, a most malignant type, with ready and rapid dissemination of the cells into distant parts. These three types illustrate excellently the main varieties in rate of growth and effect of neoplasms. In the case of the first, either natural resistance or some other factor is able to keep the alien cells completely under control, just as in the case of the simple tumour which has arisen as the result

of some irritative stimulus and which shows no tendency to progress.

The second represents a stage where this control is less perfect and irregular proliferation takes place, but there is still left some influence, or there is still wanting some factor in the cells themselves, which prevents them from passing freely along the lymph and blood vessels with the development of secondary deposits. These forms are described as being locally malignant.

The third variety obeys no natural laws. What better example could we take to show a relationship between quiescent and active tumours, or to show more clearly the three main phases of cell activity in them? The group of tumours springing from endothelium usually belong to the second type, but we do meet with instances where even these produce metastasis.

We must now unreservedly accept these teachings of pathology and look with profound suspicion upon all new growths. Indeed, I would banish the terms "innocent" and "simple" as applied to neoplasms wholly and irrevocably. As an eminent surgeon once said when lecturing on inflammation, "Some pus is called laudable—there is no such thing as laudable pus—all pus is damnable." So with respect to these tumours all tumours are evil—no tumour is innocent, that is, they can only be truly termed innocent after their possessor has died from other causes; during his life they may be quiescent, but they are certainly dangerous. Simple tumours are potentially malignant, in that they, as expressions of instability, show a weak spot in the body which may readily be attacked by cancerous change—many of them, from the earliest periods of their conception, tending to that end.

Just as an infection will select that part of the body where resistance is lowered by antecedent injury or disease, or where from some developmental or anatomical reason that part is more exposed or susceptible, so cancer will select for its beginnings those regions of the body where a weakness of the tissues has been expressed by the appearance of the simple tumour, or by the ill-ordered reproduction following chronic inflammatory change. We cannot feel proud of the results of surgery as applied to malignant disease. If these results are to be improved, attention must be paid to those conditions which precede the actual cancer. It may be taken for granted that extirpation of cancerous tumours is not the ideal treatment.

The surgery of the future will be prophylactic in many branches, above all, I trust, in cancer; so that the term "Preventive Medicine" will have a larger field of application.

In the early recognition of precancerous states we have a vast field of practical utility, and with regard to these so-called simple tumours the time has come—if I may make use of a topical allusion—to adopt a more active policy of aggression and retaliation in the protection of the individual.

THE ADVANTAGES OF THE ABDOMINAL ROUTE IN OPERATION FOR UTERINE CANCER.*

By MARY A. D. SCHARLIEB, M.D., M.S.LOND.,
Senior Physician, Diseases of Women, Royal Free Hospital,
London, &c.

ONE of the most pressing duties and one of the most exacting aims of our lives is the reduction of the mortality caused by uterine cancer. We are all seeking some remedy or some operation which may prove of general service, but up to the present time we have come to no definite conclusion, as is proved by the number of operations practised and the variety of medical and other forms of treatment. It is only within the last thirty years that any sustained attempt has been made to cure cancer of the uterus.

The great surgeons of earlier times were not able to

diagnose the disease sufficiently early to justify operation—hæmorrhage and irregular discharges were thought to be the normal accompaniments of the menopause, and local examination was not usually made until these symptoms had long been present and were associated with the characteristic odour and well-marked cachexia of the later stages of the disease. By that time, needless to say, all possibility of successful operation was passed.

In the *Lancet* for November 26th, 1881, not quite twenty-five years ago, there is a report of the first excision per abdomen of the cancerous gravid uterus. It was performed by Sir Spencer Wells and the patient recovered. In a report of the discussion on this case at the meeting of the Medico-Chirurgical Society, the opinions of many distinguished men are recorded.

Dr. Graily Hewitt congratulated the operator on his boldness and skill, he approved of the separation of the cervix from the surrounding tissues "by a process of tearing rather than cutting," and wisely thought this method conducive to the safety of the ureters.

Dr. Playfair drew attention to the bearing of the case on those of cancer of the cervix, of non-gravid uterus, and thought they should be dealt with "without running the risk of abdominal section, not by simply shaving off the growth by the écarteur, but by Marion Sims' excision of the whole of the diseased part; and the application of chloride of zinc."

He said further that "in the more common form of medullary cancer affecting the upper part and not the cervix, abdominal section had not been adopted; but in such cases diagnosis was most difficult. No one," he added, "would venture to excise a uterus because it was thought to be affected, and the element of fixation, which is so important in diagnosis, is just the element which would prevent its removal."

Dr. Matthews Duncan admired and wondered. He said "the operation had settled the possibility of successfully dealing with cancer of the uterus in advanced pregnancy, but it was one thing to determine what is possible and another what is advisable. . . . But," he said, "the commonest cases are those of the vaginal portion, and here the operation is unfavourable because of the early involvement of the parametric tissues. It was just in these cases that a thorough radical operation like this was to be desired."

Since those days the surgery of the uterus has made rapid advance and the microscope has proved a most efficient ally. The old trouble that still remains is the lamentable delusion still existing, that hæmorrhage abnormal in time or amount and hæmorrhage recurring after a prolonged period of amenorrhœa is to be regarded as the normal condition during the menopause.

We still have to deplore that a large percentage of women suffering from cancer uteri came to us too late; that many practitioners will not examine such cases, and that a still larger number are satisfied when the vaginal portion of the cervix appears to be healthy. The profession, the nurses, and the public still need converting to the belief that (1) all uterine hæmorrhage, abnormal in time or quantity, calls for examination; and (2) that all hæmorrhage, no matter how slight, which occurs in a woman after the menopause is a danger signal; and is, in the majority of instances, due to malignant disease.

Operations for cancer of the uterus may be classified as (1) supravaginal amputation; (2) vaginal hysterectomy; (3) para-vaginal hysterectomy; (4) abdominal hysterectomy.

Each method has its advantages and its disadvantages, and each operator is liable to continue to employ the method which has yielded fair results and to the performance of which he brings a certain dexterity.

If the operator is equally happy in operating per vaginam and per abdomen post-operative shock is less by the former route, but that is probably its one superiority; operation through the abdomen secures—

I. A more fully exposed and convenient field of operation.

* Paper read at the British Gynecological Society, on Thursday May 10th, 1906.

2. A better opportunity for breaking down adhesions without injury to the bladder or the intestines.

3. More adequate examination and removal of pelvic glands, especially of those lying along the course of the iliac vessels, and about the bifurcation of the aorta.

4. Less danger to the ureters, which may generally be examined and preserved uninjured while the cellular tissue is dissected away and the uterine vessels are tied to their outer side.

5. More reliable hæmostasis; the vessels being easily ligatured; a great improvement in the use of clamps, which are always liable to bruise the tissues and have been known to cause necrosis and secondary hæmorrhage.

6. The bladder and rectum are more easily separated, and are less likely to be injured.

7. The vagina can be divided lower down—a great gain in cases in which the disease has spread to the walls of this tube.

8. In bad cases less time is consumed in operating by the abdominal route; and, certainly, cases that were inoperable by the vaginal route may be successfully completed per abdomen. Especially is this the case where the vagina is long, narrow, and rigid as in elderly virgins and nulliparæ.

It is not to be expected that all these advantages will be conceded by those surgeons who have practised vaginal hysterectomy for the last twenty years, and whose operative skill and technique are in this operation very near perfection. There is, however, not one of us who does not deplore the appalling percentage of inoperable cases, the awful prospect of early recurrence. There is not one of us who would not thankfully exchange a percentage of 15 per cent. for 60 per cent., and whose patients would not gladly share in the long immunity from recurrence demonstrated by the statistics of Wertheim, Mackenrodt, and others.

When the time has come for a definite advance and the pioneer work of many workers has made it possible, the great discovery is apt to be made by several people at the same time, and places as far apart as Vienna and Baltimore ring with the fame of similar achievements.

In comparing results of operations it is not fair to compare the results of an operation reserved for the most advanced cases with the results of the one done in the least advanced. Not only must the immediate results be less favourable, but the expectation of recurrence is necessarily greater. Even if a surgeon determines to do all operations for cancer uteri in the same manner, comparison of results remains difficult; for at one time a pessimistic opinion in the out-patient department will lead to the admission to the ward of none but early cases, while at another time an optimistic colleague may send in cases which are so far advanced as to make operation doubtfully justifiable. Still, it is worth while to look at the published statistics of several well-known surgeons.

Döderling (*Hegar's Beiträge, Band ix. Heft 2*) quoted in the *Journal of the British Gynæcological Society* for 1905 publishes the following figures:—48·3 per cent. operated on per vaginam; 16·4 per cent. operate mortality; 40·6 per cent. recoveries (so-called cures); 15·8 per cent. of all cases seen by him.

Jacobs, whose excellent paper was read here in April, 1905, gave the following statistics. High amputation of cervix uteri:—13 cases, 12 recurred during first year and one after fifteen months. A most melancholy record. From 1891 to 1897 he performed vaginal hysterectomy 81 times—80 cases recovered, 1 died, 10 cases lost sight of; of the 70 remaining there was recurrence in—first year, 70 per cent.; second year, 13 per cent.; third year, 17 per cent.; and fourth year, 1·4 per cent. Not one woman was alive five years after the operation.

He performed abdominal section on 95 carefully selected cases in which the malignant disease was apparently limited to the cervix uteri, and in whom the general health was good, with the following results: Operation, 95; deaths 6=6·3 per cent.; 6 lost sight of.

Recurrence—first year, 50 per cent.; second year, 21 per cent.; third year, 4·2 per cent.; fourth year, 2·1 per cent.; fifth year, 2·1 per cent.; sixth year, 1·05 per cent. Two patients were alive at the time of reading his paper.

Mr. Jessett stated that of 180 vaginal hysterectomies for cancer, 10 died, about 5·4 per cent.; lost sight of 20. Recurrence, first year, 35 per cent.; second to fourth years, 23 per cent.; fifth to thirteenth years, 8 per cent.

Mackenrodt compares three operations each preferred by a special operator:

	Para Vag. Hyst. Schuchardt. per cent.	Vaginal Hyst. Olshausen. per cent.	Ab. Hyst. Mackenrodt. per cent.
Operability	62	50	90
Mortality	12	7	20
Recoveries	24	38	69
Recurrence	64	54	11

If these figures are to be taken at their face value, and no doubt they deserve to be so taken, abdominal hysterectomy for cancer of the cervix yielded splendid results in his hands. To find an operability of 90 per cent. and a recurrence within five years of 11 per cent. only, is a strong recommendation even when it has to be weighed against so heavy a mortality as 20 per cent.

Professor Wertheim at Leicester, in 1905, told us that of 290 cases of cancer of the cervix he had 60 to 70 per cent. free of recurrence after four or five years, and that the range of operability had increased in his practice from 15 per cent. to 50 per cent.

Bland Sutton, at Oxford, in 1904 thought that 5 per cent. only of hospital cases were operable. He preferred the vaginal route in cancer of the cervix because it occurs most frequently in parous women, but would operate per abdomen for cancer of the body, as it is commonest in nulliparæ. Authorities might be multiplied, but those quoted appear to prove the point that removal of the cancerous uterus per abdomen offers the widest range of operability and the longest period of immunity in the largest percentage of cases.

Mayo Robson in the Bradshaw Lecture on the "Treatment of Cancer," in December, 1904, gives us the following statistics: 12 total hysterectomies, no death. 1 patient alive and well after 8½ years, 1 after 7 years, 1 after 6 years, 2 after 5 years, 2 after 3 years, 1 after 1½ years, and four lost sight of.

Fourteen cases of very free supravaginal amputations of the cervix—1 patient alive and well after 11½ years 1 after 10½ years, 1 after 10 years, 1 after 9 years, 1 after 6 years, 2 lost sight of, 1 recurred after 4 years, and 5 recurred after 1 year or less.

Dr. Cuthbert Lockyer found 20 per cent. of his cases operable, and out of 13 cases had no operative mortality. He had one patient free from recurrence 4 years after operation. All these were vaginal hysterectomies, and in all the disease was cervical.

Miss Aldrich Blake's table of cases presented at the Leicester meeting of the British Medical Association is particularly valuable, because she has admitted no case in which the disease was not cervical in origin and because she has given a careful pathological report of each case. The table includes 16 cases without a death from operation, and in at least three cases there was no recurrence up to three years after operation.

The earliest of the reported operations was in May, 1902, so that the five-year limit has not yet been attained, but of all the sixteen cases two only are known to have had recurrence.

My own table of 23 cases is of far less value because it comprises all my cases of abdominal hysterectomy for malignant disease, whether of cervix or of body, whether carcinoma or sarcoma. All recovered but the first case.

Great stress was laid by Wertheim on the fact that he preferred the abdominal route because he could thus remove much parametric tissue with the organ, not primarily because he obtained readier access to the glands. He found a direct extension of the disease in

the parametric tissues in 22 per cent, of all cases, and involvement of glands in 28 per cent.

It is not a little remarkable that Wertheim, Kelly and others find that the pelvic glands are not infected by cancer in about two thirds of the cases, and that the tissue which most of all needs removal is the cellular tissue around the uterus. That this tissue is more readily removed through the abdomen than through the vagina is evident. The uterus removed per vaginam being often as it were shelled out from surrounding tissues, while the fear of wounding the ureters often prevents the surgeon from cutting as wide of the diseased organ as is necessary. Per abdomen, if the peritoneum is incised across the anterior surface of the uterus it can usually be stripped down without much difficulty, and carries the bladder and the vesical ends of the ureters into safety. Still more if Kelly's plan of splitting the broad ligaments early in the operation is carried out it becomes comparatively easy to tie the main trunk of the uterine artery near the pelvic wall, and to gradually work in towards the uterus so as to approach ureters from the outer side, and to isolate them without injury or too much difficulty. As a rule, the bladder is easily preserved, but a clean cut into it is not a fatal accident. Its walls are so vascular that it heals rapidly if not infected, and if drained by a stationary catheter for a few days. Wounds of the ureters are much more regrettable and ought to be avoided; but much care must be taken not to bruise these small and delicate tubes, and beyond all things not to injure their tiny vessels.

In the following table I have recorded 21 consecutive cases, the *bona fides* being guaranteed by the fact that the first patient died on the day of the operation. In these 21 cases there were:—

	Cases.
Sarcoma	4
Squamous-celled carcinoma	3
Glandular carcinoma	10
Endothelioma	2
Chorio-epithelioma	1
Doubtful	1
	—
	21
Death on day of operation	1
Recovered	20
	—
	21
Disease of cervix—	
Squamous	3
Glandular	4
Disease of body—	
Sarcoma	4
Carcinoma	7
Endothelioma	1
Perithelioma	1
Chorio epithelioma	1
	—
	21
Recurrence—	
Free after 6 years	1
Free after 5 years	
4'5	1
4	
3'5	1
3	1
2'5	2
2	1
1'5	
Less than 1	1
Not known	6
Died of cerebral hæmorrhage..	2
Died same day	1
Died soon after	2
Died after one year	2
	—
	21

To these may be added two cases operated on since Christmas, both of whom survived the operation.

It has not seemed possible in a short paper to repro-

duce all the statistics that are available, and yet it ought to be done and published—the literature is growing fast and in a few years will be unmanageable.

The progress made in the education of the profession and of the public has been wonderful, but it is still very imperfect and very partial. Sometimes a wave of pessimism sweeps over us and we are ready to echo the despairing opinion of a great northern surgeon, and say the benefits of operation are out-weighed by the risks. That this is a mistaken opinion all the available figures prove. The percentage of operability and of freedom from recurrence rises steadily while the operative mortality is constantly shrinking, and much is to be hoped for from the improved technique, the earlier recognition and the more constant appeal to the microscope. So let us be strong and of a good courage, the battle is to be won and victory even now hovers over our banners.

THE OUT-PATIENTS' ROOM.

FRENCH HOSPITAL AND DISPENSARY.

A Case of Cerebral Abscess with its Post-mortem Appearances.

By HENRI DARDENNE, M.D. EDIN., M.R.C.P. LON.

AMONG the out-patients at the French Hospital on April 20th, 1906, was a cellarman, æt. 48, who complained of a slight loss of power in his left arm, and inability to talk properly.

The history he gave was that on April 17th, his left hand and arm were suddenly, and without any apparent cause, affected with jerking movements over which he had no control. When these had ceased, after about an hour, he noticed that his mouth was drawn to the right. His left arm remained weak, and also his right leg, but to a lesser extent. He also stated that he had had a sharp attack of rheumatic fever about five years ago, otherwise, his health as far as he could remember, had always been good. He never suffered from headache, vomiting or giddiness, and denied having ever had syphilis or any other venereal disease. His sight had always been excellent, and also his hearing.

On examination it was noticed that he had facial paralysis of a cerebral origin, for the upper branches of the facial nerve were not involved. The movements of the orbicularis, palpebrarum and frontalis muscles were intact and the voluntary movements on that side were more impaired than the emotional ones. There was no reaction of degeneration.

His speech was laboured and indistinct, and the angle of his mouth was slightly drawn to the right side. The tongue could not be easily protruded. It presented no real deviation when its position was taken from the lower incisors.

His left arm was in a paretic state, but there was no actual paralysis. His leg was also weak and he walked with a slight limp, otherwise his gait was normal. His lungs were healthy and nothing peculiar was noticed in his ears or nose. His pupils were normal, and reacted both to light and accommodation. His temperature was normal. His pulse about 75 per minute, and regular. There was no tension and his blood vessels appeared healthy. His heart was slightly enlarged. The apex beat was in the mammary line, and in the sixth intercostal space. There was a distinct double systolic murmur to be heard at the apex, and the second pulmonary sound was accentuated.

Though he denied having ever had syphilis and though unable to find any indications to the contrary, a mixture containing 15 grains of bromide and 20 grains of iodide of potassium three times a day was prescribed, and as he refused to be admitted he was advised to go to bed at once. In the afternoon on the same day, Dr. Dardenne received an urgent call to go and see him as he was very ill. Dr. Dardenne said that on arrival he found the patient was suffering from a very severe attack of Jacksonian epilepsy. His whole left arm was affected with clonic spasms, and this at the rate of about 30 per minute. His pupils appeared

normal. His face was still paralysed, and his left leg could be moved only with considerable effort on his part. He was conscious. His tongue could hardly be protruded and his speech was most indistinct. His temperature was 103° F.; and he was perspiring very freely, and a glowing heat arose from his couch and pillow.

Immediate removal to the French Hospital was advised, and he was admitted the same afternoon.

This attack gradually passed off, and on the 23rd he had improved slightly and his speech was clearer. On the 24th he was worse, and at times comatose. The left leg was now quite paralysed, and anæsthetic. Both knee-jerks were absent and the left external rectus was paralysed. He became more and more comatose and died on the 26th. During all the time he was in the hospital his temperature remained normal, and at no time did he complain of headache; neither did he suffer from vomiting.

Only a partial *post mortem* could be obtained. On removing the skull cap, the meninges on the right motor area were found to be covered with a purulent fluid, and an abscess about the size of a small walnut was situated in the middle third of the ascending frontal and parietal convolutions on the right side. It had ruptured and its cavity presented a ragged aspect, and the adjacent convolutions were more or less torn and shreddy. It contained no definite capsule. The cavity encroached by its two extremities into the upper and lower thirds of the ascending frontal and parietal convolutions. The abscess was distinctly of an acute nature, and of recent origin. The meninges were not thickened anywhere, and the brain presented a normal aspect, except in the immediate vicinity of the abscess cavity, where it was deeply congested, and somewhat œdematous.

Remarks:—This case of cerebral abscess presented none of the ordinary characteristic symptoms such as fever, delirium, vomiting, and rigors, and as to its etiological factors, there was never any history of trauma. The patient's lungs were sound, and so were his auditory organs. He never suffered from any of the specific fevers or from influenza, and there were no bone or liver affections present. Most likely the cause of the abscess was a septic embolus, which got detached from his diseased mitral valves, he had had a sharp attack of rheumatic fever five years ago. It was certainly one of those cerebral cases which, had it been possible to form a definite diagnosis, would have had a great chance of being cured by proper surgical interference, the localising symptoms being most typical.

OPERATING THEATRES.

ST. PETER'S HOSPITAL.

ENUCLEATION OF THE PROSTATE.—Mr. SWINFORD EDWARDS operated on a man, æt. 73, who had had difficulty in micturition for the past two years, during the last year of which he had to rely entirely on his catheter. There had been some slight hæmorrhage on one or two occasions, probably due to some damage during catheterism. Per rectum, the prostate was markedly though not much enlarged, elastic, and fairly movable. Mr. Edwards found cystoscopy on the present occasion impossible, owing to the contracted condition of the deep urethra; he therefore proceeded at once to do a suprapubic enucleation. On opening the bladder the finger only found a small nipple-like projection from the posterior part of the vesical orifice. Mr. Edwards did not consider that relief would be obtained by simply removing this projecting part of the prostate; he looked upon the obstruction to micturition as being due rather to the

elongation and compression of the prostatic urethra by the hypertrophied prostate. The enucleation was carried out in the manner usual at St. Peter's Hospital, that is to say, by scratching through the mucous membrane over the projecting portion of the prostate, this gland having been pushed well up towards the suprapubic wound by two fingers in the rectum, and steadied there, then sweeping the finger or fingers (whichever may be the more convenient) completely around the gland, working in a plane between the capsule of the prostate and the inner layer of the prostatic sheath. In this case the prostate was removed whole, and was lying free in the bladder within three minutes from the commencement of the enucleation. The operator found that the point or points at which the freeing process was most difficult was at about the level of the entrance of the common ejaculatory ducts; this, he said, was the usual spot where the surgeon may encounter the most difficulty in the enucleation of the prostate. Another place where surgeons may expect a little difficulty is in tearing through the junction of the prostatic and membranous urethra. In some cases, a large portion of the prostatic urethra remains behind, the prostate, being, as it were, pulled off it as a strawberry is pulled off its stalk; in other cases quite a considerable quantity of the membranous urethra is torn away; but Mr. Edwards did not look on this as advisable if it could be avoided, for in one such case in his own practice a stricture resulted for which an internal urethrotomy had to be performed, thereby increasing the length of time of convalescence and necessitating the regular passage of a steel bougie. This was the only case of stricture Mr. Edwards had had following this operation. The prostate was now removed from the bladder with a pair of forceps; the two fingers of the right hand were again introduced into the bladder, whilst two fingers of the left hand were inserted into the rectum, the left hand being as before covered with a rubber glove. The walls of the prostatic cavity were next well pressed together by the opposing fingers. This reduced the size of the cavity and tended to prevent hæmorrhage. In this particular case the absence of hæmorrhage was remarkable. A one-inch diameter rubber drain was now inserted into the bladder through the suprapubic wound and fixed by a suture to the integument. A small gauze drain was left in the pre-vesical space and three silkworm gut sutures brought the edges of the external wound into apposition, leaving room for the drains. It was not found necessary to insert any deep sutures. The prostate was passed round, and Mr. Edwards pointed out the fact that it was removed whole, and that bands of non-stripped muscular fibre were well marked, running across it, this showing that the gland had been removed with its capsule; for, had the adenomatous masses been taken away from within the capsule, such muscular fibres would not have been present. In this case, he said, the prostate could not have weighed more than an ounce, showing that the size of the gland was no measure to the obstruction caused to micturition. With regard to the sheath of the prostate, he pointed out that it was derived from the recto-vesical fascia and embraced the prostate by two chief layers; the innermost lies between the prostatic capsule and the surrounding plexus of veins, whilst the outer one passes over the veins and encloses them. It would thus be seen that if the enucleation was carried out in the proper plane severe hæmorrhage was avoided, and the operation itself was not so liable to be fraught with disastrous results, as the pelvic fascia is not opened up.

TRANSACTIONS OF SOCIETIES.

THE BRITISH GYNÆCOLOGICAL SOCIETY.

MEETING HELD MAY 10TH, 1906.

MR. BOWREMAN JESSETT, President, in the CHAIR.

Mrs. SCHARLIEB read a paper entitled: "The Advantages of the Abdominal Route in Operations for Cancer of the Uterus," which will be found on page 551 *ante*.

Mr. MAYO ROBSON thought the first thing to be recognised both by the profession and the public was, that cancer, wherever situated, was a local disease. If only the attention of the public could be drawn to that fact and lead them to seek advice at an early stage, whether in regard to cancer of the stomach or cancer of the breast, or cancer of the intestine, surgeons could promise them that in 30-50 per cent. of cases a cure would be effected. He would not limit the term cure to merely the absence of recurrence within three years, but for longer periods than that. In his Bradshaw lecture, to which Mrs. Scharlieb had been good enough to refer, he tried his best to present statistics from many authorities in regard to operations for cancer in various organs, both as to the immediate risks and the ultimate results. Those statistics, whatever might be thought of their value, were at all events honestly given. And many of them were very remarkable. For instance, Dr. Halstead's operations on the breast—and he referred to the breast although he believed in that case it applied to the uterus as well, because in the breast one was able to take away not only the tumour itself, but also to follow that up by removing the glands, and that was of importance in relation to the abdominal route in uterine surgery. In those cases he believed Halstead had had 42·8 per cent. of cases in which there had been no recurrence in from three to four years after the operation. In the early days of his work supra-vaginal amputation of the cervix certainly did really effect a cure, and in many of them he knew the patients were living years and years afterwards in absolute and perfect health. As soon as the disease had extended into the uterus from the cervix, he was clearly convinced it was infinitely better practice to do the operation by the abdominal route. When doing the vaginal operation the surgeon knew he was simply removing the local disease, and there was no possible opportunity of removing the glands or the cellular tissue of the broad ligaments. But by the abdominal route, with the patient in the Trendelenberg position, everything could be seen most beautifully, the broad ligaments could be widely removed, and complete hæmorrhage could be brought about. That operation did not cause a moment's anxiety, for the uterine and ovarian arteries could be ligatured, and having removed the uterus one could lay open the peritoneum along the crest of the ileum and pick out the glands carefully, without hurry and without danger. In that way one was able to do just as complete an operation in cancer of the uterus as in cancer of the breast. Not only so, but it could be done with very little shock as there was such slight exposure of viscera. He could not understand the paper which was given by an eminent specialist in the North, who gave such a gloomy picture of the results after hysterectomy for cancer. It was his own opinion that cancer of the uterus is a curable affection if seen early and removed widely. It was a more satisfactory operation if done by the abdominal route. He thought the chief lessons which had to be learnt were, that operation should be undertaken early, and that efforts should be made to educate the public, so that if after the menopause abnormal hæmorrhages were seen they ought immediately to

seek advice. A determined effort was being made in Germany to promulgate that knowledge, but in England it did not seem to be possible, owing to the probable imputations either of charlatanism or self-advertisement.

Mrs. STANLEY BOYD said that if operators succeeded in getting the cases as early as they wished, any good operation would succeed. Supra-vaginal amputation succeeded in the early days, no doubt, because cases were carefully selected, and those operated on were all in an early stage. Mrs. Scharlieb, in previous papers, had given excellent results by the vaginal method, and if cases were taken sufficiently early, possibly equally good results would follow. But the fact was that many cases came which were not in such an early stage of the disease as one wished, and therefore it was incumbent upon surgeons to seek a method which would give the operator the means of dealing in more advanced cases with some hope of success, as did the abdominal method where the disease had passed the limits of the organ in which it originated. She began to operate by the abdominal route in July, 1901, because she was unhappy over the results obtained by the vaginal route. She was not more satisfied with her results by the abdominal route, but that was partly because in her early cases the technique was not as good as it might have been, and also because some cases were rather far advanced. Since July, 1901, she had had nineteen cases of malignant disease of the body and the cervix, eight being malignant disease of the body, and eleven of the cervix, those of the body including one case of sarcoma. In two of the cases of cancer of the cervix the operation was practically the combined operation, that is to say, begun as vaginal hysterectomy and finished by the abdominal method on account of the difficulty of bringing down the uterus from adhesions. Out of the whole number she had two deaths, one of which was purely from sepsis. Two of those nineteen cases were complicated by pregnancy. In another case of five months' pregnancy the uterus was removed with cancer of the cervix, and she remained well. Three out of the whole number of the cases of cancer of the body were complicated by fibroids. Out of the eight cases of cancer of the body, four remained well. One was well after five and a half years—and that was a case of sarcoma. One was well after four and a half years, one after two years, and the last was only recent, having been operated on only five months ago, and therefore of very little value. As already mentioned, one died of suppuration of the abdominal wound. Two showed metastasis within the first year, and one was thought to have died within two years of operation, and therefore probably from recurrence of the disease. There were eleven cases of cancer of the cervix, and of those, one which she had already mentioned died at the end of operation. In three the disease recurred locally, all of them within two years, and one died within a year. Therefore it might be said that four recurred locally. Of three she could not trace the after-history. But as they were fairly recent, she was still hoping she might get news of them. Two were at present in hospital. It had been said that the operation for cancerous cervix was a very dangerous one because of bringing the cancer of the cervix through the abdomen. In her cases the abdominal wound suppurated in three, and one of them proved fatal. One case suppurated but healed very well, but one at present in hospital was complicated with extensive pelvic cellulitis, and most troublesome cystitis. Another case showed a vesico-vaginal fistula at the end of the first week, apparently from necrosis of a piece of the bladder.

She had found enlarged glands in three of the nineteen cases mentioned. Of those three, microscopical

examination showed cancerous deposit in only one. Stripping down the peritoneum would not carry down the ureters, they needed careful dissection anteriorly, and that was the most troublesome part of the operation. Stripping the peritoneum could not clear the ureters, because anteriorly they were not in contact with peritoneum but were embedded in connective tissue. She had seen the ureters literally dissected out of a cancerous bed, leaving a distinct and deep groove in the connective tissue removed which could be well seen. She believed surgeons would very much extend the field of operation by adopting the abdominal route.

Dr. MANSSELL MOULLIN would have liked to have heard a little more definitely the arguments in favour of the abdominal route as compared with the vaginal. In his opinion such cases as those under discussion must largely depend upon two elements: first, on the nature of the case, and secondly, on the bias of the operator. Anyone who had special experience in operating by the vaginal route would no doubt be able to do very much more by that route than one who had not such experience. He thought the abdominal route offered certain advantages. It enabled the operator to see what he was about and to ascertain more exactly the extent of the disease, whether the bowel had been involved or the glands affected. If the bowel and lymphatic glands were infected, it was better not to proceed to eradicate the disease if it was fairly clear it could not be done successfully.

Dr. PURCELL said it was twenty years since he began the operation by the vaginal route, with a mortality of 20 per cent., which was afterwards reduced to 17, 15 and 12 per cent. His cases were not selected, they came seriatim, and he operated upon them. Latterly the mortality of the operation was 5 per cent. or 6 per cent. In cases seen sufficiently early, the uterus could be removed by the vagina in about 20 minutes. In more difficult cases the operation will occupy about an hour or even one hour and a half. But it must be always remembered that the longer the operation lasted the greater was the risk to the patient, and that if one hour were exceeded in performing the operation the patient would most probably die. One of the chief dangers with regard to the operation per vaginam was that of injury to the ureters, and that had to be considered by those who selected that route. That risk would be avoided by choosing the abdominal route, and the uterine and ovarian arteries could both be tied. In some cases, where the parts were fixed, the uterus could be curetted and plugged with chloride of zinc paste. He had exhibited to the society casts of the entire uterus, showing the whole of the internal surface sloughed away. Those cases which were past operation did well under the chloride of zinc paste. All gynaecologists would say that if the body of the uterus was the part affected, either by carcinoma or sarcoma, the abdominal route was the one that should be selected and panhysterectomy should be the operation.

Miss ALDRICH BLAKE said she proposed to speak of a single operation which was carried out entirely through the abdomen. She did not do any part of the removal through the vagina, though of course one cut across the vagina to remove it, and that was done from above. She fully agreed with former speakers as to the importance of early diagnosis but the want of it was by no means always due to the neglect of patients to seek advice. Numbers of patients came and said that they had consulted their usual medical adviser, who had told them what they themselves and their neighbours believed—that the symptoms complained of were due to their time of life. She had practised the abdominal route four years because it seemed to her, from the experience in removing fibroids from the abdomen, that it secured freer and easier removal than appeared possible from the vagina. The vagina itself was more easy to remove freely when beginning from the abdomen than from below. With the Trendelenberg position, she thought one could get as far as possible from the disease

in the cervix, sparing nothing but the ureters and the bladder and the rectum. She had never removed any part of the rectum with the uterus, because it seemed to her that in none of the cases which were otherwise suitable was it implicated. Of her 34 cases six were of the body and none died. Twenty-eight were in the cervix and vagina, and two of them died. So that in cancer altogether the percentage on the whole 34 cases would be just over 5.9 per cent., or taking the cancer of the cervix alone, about which she thought there might be more doubt as to the advisability of the abdominal route, the mortality of her own cases had been 7.1 per cent., and of course she hoped it might grow less rather than more.

Dr. HEYWOOD SMITH said much of the responsibility with regard to delay before seeing an operator rested with the medical man. The practitioner so frequently fell in with the patient's own suggestion as to her diagnosis, and thought it was due to the menopause; and instead of recognising the menopause as the cessation of hæmorrhage and not the increase of it, she was told that it was some weakness. It used to be the object of surgeons to remove the tumour through the smallest abdominal incision possible. But a few inches more or less in the length of the incision did not increase the shock perceptibly nor lessen the patient's likelihood of recovery. Moreover, by the freer incision it was possible to thoroughly explore the pelvis, and with the patient in the Trendelenberg position, there was no doubt a greater likelihood of thoroughly removing the disease by the abdominal route. He thought the Society might well undertake the production of a pamphlet addressed to general practitioners and also to the public, especially to the women of our country, pointing out certain prominent symptoms which might arise, and urging them on the appearance of such to get proper medical advice.

Mr. RYALL said the abdominal operation appeared the more scientific of the two. By the vaginal route it was necessary to deal with the broad ligaments and tie them *en masse*, whereas by the abdominal route one could deal with them in a more surgical manner. Also, by the abdominal route one could remove glands which could not be got away by the vaginal method. He had been very interested to hear what Miss Blake said about the gland which she mentioned on the uterine artery where it was crossed by the ureter. He had noticed that occurring sometimes. In his last case it was considerably enlarged, and yet when examined microscopically there was no evidence in it of malignant infection. Shock in abdominal operations was due to the amount of handling which the viscera underwent and to their exposure. But pelvic operations were borne remarkably well, and with the intestines out of the way the amount of shock might be said to be reduced to the minimum. The abdominal operation certainly occupied a longer time if the surgeon conscientiously and properly closed the wound. On the other hand, if he chose the vaginal operation there was very little closing up of that kind to be done, the operator hid the results of his work by a plug of gauze, and left the rest to Nature. He scarcely agreed with the remark that if the glands were found at the operation to be enlarged the operation should be abandoned. That should not be regarded as a sufficient reason for giving up the operation, especially as it would be very often found to be merely a hyperplasia in which there were no cancerous elements. The disease tended to spread along the vagina and recurrence occurred in the vaginal walls and followed the course of the uterine and internal iliac veins. The advantage of the abdominal route was in being able to remove the seat of origin of the disease. But when invasion of the broad ligaments took place the operator would be sure to damage by the vaginal route the ureters or leave some of the disease behind, whereas by the abdominal route it was easy to dissect up the ureters and free them.

Dr. R. T. SMITH said there was one consideration which he had found in his experience, and which

might be added to the reasons given for operating by the abdominal route. It was that that route enabled one to be aware of any previously existing peritonitis which might have caused adhesions. He remembered one case in which he removed a fairly large portion of the cervix by the vaginal method, and afterwards he was obliged to remove the whole uterus. The patient died three or four days afterwards from intestinal adhesions, and it was found post mortem that that had been caused by some previous peritonitis. In that case, if it had been done by the abdomen there was no doubt the adhesion would have been detected during life, and the patient's life might have been saved. He also emphasised the importance of recognising and treating eroded and lacerated cervixes as a prophylactic against cancer.

Dr. SMALLWOOD SAVAGE remarked that the time occupied by the operation was an important matter, and he would like to hear whether Mrs. Scharlieb cleansed the vagina previously to giving the anaesthetic.

The PRESIDENT said the subject was the most important in gynaecology. It had to be remembered that twenty years ago those poor sufferers had nothing done for them, they were left to die of their disease, whereas now perhaps 15 per cent. to 20 per cent. who came to the operator soon enough could be cured. Surely that was a great triumph for gynaecology, and he thought the Society could justifiably feel somewhat proud of having been instrumental in bringing about that desirable change. Of course, the great point was early diagnosis. But he did not think sufficient stress had been laid on the importance of the situation of the growth in the uterus. If there were growth of the os, recognised at an early stage, it seemed unnecessary to choose the abdominal operation and submit the patient to an operation which was more severe than the circumstances called for. In the last two or three weeks he saw six patients who were operated upon by him twelve or fourteen years ago by supra-vaginal hysterectomy. He gave up that operation because four out of six cases upon which he operated before the menopause had atresia of the canal, and in several cases a further operation was necessary for that condition. They were done before the occurrence of the menopause, but they were alive and well now, ten or twelve years afterwards. One poor woman turned up at the hospital the other day whom he had lost sight of for years and had forgotten. As she reminded him of the operation, he looked up his notes and found that twelve years ago he removed a cancer of the uterus. His idea was that the pendulum was now swinging too much in the direction of very radical operations. If a patient came after the menopause with cancer of the os or cervix, and was debilitated she could be operated upon quite well and successfully by supra-vaginal hysterectomy, and with a fair chance of freedom from recurrence, whereas if the more severe abdominal operation were chosen it might be the cause of her death. He did not advocate removal by the abdominal route in all cases of cancer in any part of the uterus. He took exception to that so far as cancer of the body of the uterus was concerned, because in that condition so limited he was sure the glands were not infected, and in the majority of cases which he had seen he was sure that pelvic glands were not affected, certainly not nearly as many cases as were supposed to have been involved. With regard to shock, there was no doubt that the shock following the abdominal operation was considerably greater than that after the vaginal, especially if the woman had been suffering from severe hæmorrhages. It was possible to remove the whole of the adnexa by the vagina without difficulty, when the uterus was mobile. He did not intend to try that method. Dr. Purcell referred to the combined operation, and he thought there was something to be said for it. He had seen several cases with extensive disease, and saw Dr. Purcell operate on one where there was a large uterus, with a sloughing mass coming through the vagina. He separated the

vagina all round, and pushed the bladder out of the way, opening up the abdomen and removing the whole lot through the abdominal wall. With regard to the chloride of zinc treatment referred to, he showed a large number of cases before the Society, ten or twelve, and it was astonishing how much disease could be removed by means of chloride of zinc. He had shown casts of the whole uterus apparently. One very interesting point was that in the first two or three cases in which he applied it he went down the next day to the hospital expecting to see the patients in agony, but found that they were in no pain whatever, and in ten days time the uterus all came out when it was taken hold of. But the after effects from the use of the substance were not encouraging, there was considerable contraction afterwards when the cicatrix closed up, and the patients suffered much pain, and very often the uteri were found to be implicated, and therefore he felt that he must give up the treatment. He agreed that when the larger part of the uterus was involved the operation should be carried out through the abdominal route, provided that the disease had not extended into the tissues beyond the vault of the vagina. If the disease extended from the cervix into the cellular tissue round the neck of the uterus, he did not think that if one got more of the vagina away there would be much of the disease left behind. To sum up, he would say that the vaginal method should be used where the disease was in the lower part and in the os, but where it implicated the cervix and beyond, the abdominal route was the right one.

Mrs. SCHARLIEB, in reply, said that the extent to which those who took part in the discussion had agreed with her made it almost unnecessary to advance further arguments in favour of the abdominal route. No one would think of removing a cancerous uterus with a fungating mass protruding through the os by the abdomen without having first cauterised or otherwise destroyed that mass. With regard to shock, the elements in the production of shock, other things being equal, were the exposure of the intestines and the unnecessary injury if they were exposed. The moral of that was to put the patient in a good Trendelenberg position and pack the intestines off. With regard to time occupied by the two operations, the longer the time taken the greater the degree of shock. And she thought it must depend on the nature of the case and the experience of the operator how much time would be expended in each case. It was true that in the case of a lax vagina in a woman who was a multipara, the uterus could be got down through the vulva, and it should be possible to remove it in twenty minutes, but she had sometimes spent from one to one and a half hours over it. That was longer than by the abdomen, because when the patient was in the Trendelenberg position with a good exposure, one was able to get the uterus out within an hour. Chloride of zinc, she admitted, made beautiful sloughs, but she was afraid of having sloughs from the bladder and rectum. She had used it in inoperable cases, but not otherwise. She had read a paper some time ago before some medical men, and urged very strongly that women who had hæmorrhage of unusual amount or irregular in time should be examined. And the medical men present got up one after another and said they would not dare to do it, that if they proposed examination of such patients they would soon be left without any patients at all. It was a lamentable fact that it should be so, and therefore the only course open was to educate both the profession and the public, including nurses.

At the invitation of Dr. W. Jones Greer, F.R.C.S.I., president of the Newport Medical Society, Sir Thomas Moyle, ex-president of the Royal College of Surgeons, Dublin, gave an address on "The Value of the X-rays to the General Practitioner" last week at the Newport Infirmary.

SOCIETY FOR THE STUDY OF DISEASE IN CHILDREN.

MEETING HELD MAY 4TH, 1906.

Devoted to the exhibition of Pathological Specimens.

MR. G. PERNET in the Chair.

DR. E. HOBHOUSE (Brighton) showed a specimen of congenital pyloric stenosis from an infant of 6 weeks. The child died the night before it was intended to operate.

DR. E. C. MACKAY exhibited a specimen of cerebrum with a tumour situated in the anterior half of the right side, which is probably glioma.

DR. CAUTLEY exhibited (1) a larynx with congenital laryngeal stenosis from a child of 5 months, the epiglottis is folded on itself longitudinally so that the superior aperture is much narrowed; (2) a specimen of abnormal sutures of both parietal.

DR. SUTHERLAND exhibited a skull with congenital syphilis and hydrocephalus; it shows well-marked craniotabes, also the results of intra-cranial drainage for hydrocephalus. The skull has contracted until the bones are over-riding.

DR. A. LEATHEM exhibited (1) a specimen of stomach showing ulceration round the pylorus, covered with diphtheritic membrane. (2) A microscopic section of a piece of membrane from the pylorus, showing diphtheria bacilli.

DR. J. G. EMANUEL (Birmingham) showed three specimens of congenital deformity of the heart. In the first (lent by Dr. G. W. Powell) the aorta and pulmonary artery arose from a single ventricle, probably the right. All the valves were normal. In the second (lent by Dr. O. J. Kauffmann) the aorta arose from the right ventricle, and the pulmonary artery from the left, and the foramen ovale was widely open, this specimen was from a boy, *æt.* 11. In the third (lent by Dr. Stacey T. Wilson) the membranous part of the inter-ventricular septum was absent and the aorta arose as much from the right as from the left ventricle.

DR. F. LANGMEAD exhibited (1) a specimen of primary sarcoma of lung removed from a girl, *æt.* 5. The signs during life were those of pleural effusion. Post-mortem the left side of the thorax was occupied by a large mass of new growth; it was situated within the lung, and was strictly limited by visceral pleura, except in the upper and outer part of the thorax. No growth was found elsewhere. (2) A specimen of brain showing meningeal hæmorrhages due to whooping-cough; the coughing had not been especially severe before the onset of the nervous symptoms. (3) A skull and lower jaw from a child who died of meningitis. The skull showed several areas of tuberculous osteitis, the bone, with the exception of the inner table, was replaced by caseous material, a similar condition was found in the lower jaw and malar bones. (4) A microscopical section from a girl, *æt.* 8 months, showing many tubercle bacilli from the base of a gastric ulcer; a second specimen from a boy, *æt.* 1 year and 11 months, also showing tubercle bacilli.

MR. GEORGE PERNET exhibited (1) microscopical sections of *nævi cystepitheliomatosi disseminati* (lymphangioma tuberosum multiplex). This is a very rare disease, consisting of numerous small tumours situated about the upper part of the front of the chest mainly, but also on the back and face. The specimen is from a woman, *æt.* 25, in whom the growths are said to have appeared at 16. The histological appearances are small cysts with colloidal contents and strands and aggregations of cells, which Mr. Pernet considered were of epithelial origin. (2) A drawing and photograph of racial pigmentation on the buttocks of a Siamese baby, received from Dr. Gimlette, of Kelantan, Siam.

DR. G. CARPENTER exhibited (1) a specimen of congenital morbus cordis. (2) Interstitial nephritis and cirrhosis of the suprarenal capsule. (3) Tuberculous

kidney removed by operation, from a girl of 10 years. (4) Lung, with multiple abscesses, from a child of 3 years, with pyo-pneumothorax.

MR. H. S. CLOGG exhibited (1) a specimen of fibro-sarcoma from the parotid gland; (2) An angio-sarcoma from the parotid gland. (3) A sac from a right inguinal hernia, studded on its inner surface with miliary tubercles.

NORTH OF ENGLAND OBSTETRICAL AND GYNÆCOLOGICAL SOCIETY.

MEETING HELD AT LEEDS, ON MAY 18TH, 1906.

MR. R. FARRELL, President (Sheffield), in the Chair.

FATAL CASE OF VARICOSE VEINS IN THE VULVA.

DR. J. B. HELLIER (Leeds) showed the uterus with the undisturbed placenta and membranes of a woman who died undelivered of hæmorrhage entirely from varicose veins in the vulva. The bleeding occurred in the street, and the patient was brought into hospital dying. Dr. E. O. Croft had recently seen a case of serious post partum hæmorrhage in which the blood came from a lacerated varicose vein just inside the vaginal orifice.

DR. HELLIER also showed two blighted ova which had been retained for several months in utero, together with a living twin, which perished during an eclamptic seizure near term.

DR. W. K. WALLS (Manchester) described a case of early cancer of the cervix in which, during vaginal hysterectomy it was found that the posterior uterine wall was firmly attached to the anterior rectal wall by a mass of tissue which subsequent investigation proved to be a new growth of epithelial origin. The tissue between the cervical cancer and the mass in the posterior uterine wall was perfectly healthy.

THE PRESIDENT mentioned the case of a patient, *æt.* 28, who miscarried at the sixth month of her second pregnancy, and was then found to have a large fibroid in the posterior wall of the uterus and cystic disease of both ovaries. Bleeding was so severe as to indicate hysterectomy, which was done six weeks after the miscarriage. The fibroid was a typical example of the change known as red degeneration.

DR. W. WALTER (Manchester) showed

FIBROMYOMA REMOVED BY ABDOMINAL PAN-HYSTERECTOMY,

from a patient, *æt.* 60, on account of hæmorrhage which began ten years after the menopause. Microscopic sections of the fibroid showed that angiomatous changes were in process. The patient had undergone a previous abdominal section, and the uterus was adherent to a portion of the abdominal wall, otherwise the size of the tumour would not have prevented its removal by the vagina, which, though senile, could have been enlarged by paravaginal section.

DR. LLOYD ROBERTS (Manchester) described the case of a woman whose symptoms were dysmenorrhœa, pelvic pain and ovarian tenderness. She was better after being curetted, but was later readmitted to hospital with pain in the left leg and loin, and with pus and blood in the urine. The left kidney was enlarged and incision was followed by the evacuation of a quantity of pus and mucus. The kidney was finally removed, and ten days later the patient died with complete suppression of urine. The right kidney was then found to contain a large mass of calculi which had destroyed its function.

LAMINARIA TENTS.

SIR W. J. SINCLAIR (Manchester) showed plants of sea-tangle (*laminaria*) from the coast of Iona, and tents manufactured from this material by the crofters of the island. The *laminaria*, after drying, was soaked in a solution of mercuric chloride until swelled to its full size. The tents were then fashioned roughly, and after being again completely dried, were trimmed and polished. These tents were therefore not only sterile, but were actually antiseptic. Tangle tents were first described by Dr. Sloan, of Ayr, in the *Glasgow Medical Journal* in 1862. Sir J. Y. Simpson popu-

larised their use. In 1870 they were already condemned in the *Edinburgh Medical Journal*, and readers on the subject would see that the evil reputation which tents acquired was solely due to the fact that they were introduced in days when not only were antiseptic precautions unknown, but when ordinary cleanliness was ignored in surgical work, Simpson himself remarking that it was economical to hang up a tent to dry after use in order that it might serve a second time. Tents reached Germany at a later date, when antiseptics were coming into use, and thus escaped obloquy in that country, where they were still largely used and where alone they were manufactured. Laminaria had a much greater co-efficient of dilatation than turgella wood, the root of *nyssa aquatica*, and laminaria tents should be freely used now that it was realised that they could not be a source of infection unless improperly used. They were much better and safer than any rapid mechanical dilators. The small tents shown were for dilatation of the unimpregnated uterus; but, from the size of the plants shown, it was clear that tents could be made (for use during pregnancy) large enough to secure dilatation admitting two fingers and permitting version. Long rods of laminaria could also be used for the induction of premature labour instead of the ordinary bougie, as their expansion would have its effect in stimulating uterine contractions, and would produce cervical dilatation at the same time. A further point was the desirability of supporting British industry by using tents made by the crofters of the western islands close to the source of the raw material, instead of buying tents imported from Germany.

HARVELIAN SOCIETY OF LONDON.

"Clinical Meeting" held May 10th, 1906, at the Paddington Infirmary.

Dr. MAURICE SQUIRE showed the following cases:—

1.—*Hæmorrhage into right crus cerebri*.—Woman, æt. 57, fell down on getting out of bed, and remembered nothing more till the next day. On admission to the infirmary, there was complete paralysis of muscles supplied by right third nerve, paresis of left face, arm and leg, with deviation of tongue to the left. Condition improved so that she could partially open right eye, but now movements of left eye are impaired so that she cannot move it beyond middle line in either direction. Discs normal.

2.—*Periostitis of humerus in child* of 3.—Twin brother has similar affection in one arm. The case was discussed by Dr. Willcox and Dr. Hall.

3.—*Infantile paralysis* in child, æt. 2, affecting anterior tibial muscles of right leg.

4.—*Case of sprue* in man, æt. 30. Patient was a soldier who had been 8 years in India, where he had "continued fever." Present illness started six months after return home in 1904, with vomiting and diarrhoea, which has persisted on and off since. On admission April, 1905, emaciated, denudation of epithelium of tongue, copious offensive light-coloured stools. The case was discussed by Dr. Willcox, who had found a milk diet beneficial in a similar case.

5.—*Case of scleroderma* in man, æt. 43. The disease had commenced at the age of 14. There were patches of scleroderma on shins, feet, thighs and arms.

6.—*Carcinoma of pylorus*, with secondary growth in liver in man, æt. 45.

7.—*Case of myopathic dystrophy*.—Patient was man, æt. 45, who first noticed weakness of muscles of upper arms in 1905, which has steadily increased. No history of any similar affection in other members of family. On admission, March, 1906, marked wasting of sternomastoid, trapezius, latissimus dorsi, pectoralis major deltoid, biceps and triceps, some wasting of scapular muscles and thumb muscles in both arms. No anaesthesia, no fibrillary tremors. Muscles react to Faradism and galvanism. Patient has improved considerably by treatment and gained power in many

of the affected muscles, which have increased in size. He has gained 18 lb. in weight.

8.—*Dislocation of sternal end of left clavicle* in man, æt. 70, who was knocked down by a van, the wheel passing over his chest and fracturing second and third ribs on left side as well.

Dr. WILLCOX showed a case of

RHEUMATOID ARTHRITIS IN BOY, ÆT. TEN.

Two years ago he complained of pain in hands and feet, and gradual thickening of joints took place. There is now marked thickening on inter-phalangeal joints in both hands with limitation of movement, and also thickening of inter-phalangeal joints of toes. Hands and feet always cold and turn blue in cold weather. Frequently suffers from chilblains.

The case was discussed by Dr. Winslow Hall and Dr. Macevoy.

Dr. WILLCOX also showed a case of a man, æt. 31, with ataxic gait, marked nystagmus, and total deafness. Two years ago he had syphilis. One year ago became ataxic, and hearing failed, being completely lost in six weeks. Knee-jerks lively, plantar reflexes, flexor response, no sphincter troubles; no facial or ocular palsy. Discs normal. No tremors, no anaesthesia. Has suffered from headache but no vomiting. The deafness was attributed to intralabyrinthine syphilis, and the other symptoms to pachymeningitis round the cerebellum.

ULSTER MEDICAL SOCIETY.

THE Eighth Meeting of the Session was held in the Medical Institute, Belfast, on THURSDAY, May 17th, Dr. CALWELL, President, in the Chair.

On the recommendation of the Council, the following resolution was proposed by Professor Lindsay, seconded by Dr. Morrow, and passed unanimously:—That we, the Fellows and Members of the Ulster Medical Society are strongly of opinion that, in the interests of the citizens of Belfast, and with the object of insuring the confidence of the medical profession, and of bringing the health department of the city into line with what is being done in other cities of similar size and importance, it is absolutely essential—(1) That the new medical officer of health should be possessed of high skill, scientific knowledge, and thorough practical training and experience in public health—a subject which has now become a pure speciality. (2) That the present remuneration, which is inadequate to attract suitable candidates, should be increased. (3) That in any rearrangement of duties the new medical officer of health should be sole head of a department in charge of the health of the city in all its branches, and should alone be responsible to the Health Committee and City Council for the proper administration of all matters pertaining to the health of the city. It was decided to send copies of this resolution to the Lord Mayor, City Clerk, the members of the City Council, and to the Local Government Board, and that a deputation should wait on the Health Committee and on the next meeting of the City Council.

FRANCE.

Paris, May 20th, 1906.

FOREIGN BODIES IN THE ŒSOPHAGUS.

THE most common of all foreign bodies of the œsophagus, especially in children, is that of pieces of money.

Called to a child who swallowed a piece of money, the practitioner, says M. Caubet, will have to satisfy himself on two questions: Is the piece arrested in the œsophagus, and at what point?

By what means can it be extracted?

The answer to the first question is to-day furnished by the radioscope; by placing the child before a screen, it will always be easy to see the shadow of the foreign

body, and to fix its situation, which is generally at the upper orifice of the thorax.

As to the mode of extraction, many opinions prevail. Some recommend extraction by the natural outlet (Kirmisson, Broca, Jalaguier), others, with M. Sébillan, condemn this method in favour of external œsophagotomy, while still others only advise œsophagotomy where the first attempt at extraction by the natural way has failed.

At the last meeting of the Société de Chirurgie, a member related a case of a set of false teeth impacted in the œsophagus and removed by external œsophagotomy after repeated attempts at extraction by the mouth. A large number of speakers (Sébillan, Pozzi, Tuffier, Kirmisson, &c.) declared that when the foreign body had pointed angles no attempt should be made to extract it by the pharynx; that œsophagotomy should be performed as soon as the position was made known by the radioscope.

The instruments used by the partisans of the first method are the basket of Græfe, and the hook of Kirmisson.

The former is the best-known, and the most employed in spite of its disadvantages, which are constant; it is too large and consequently liable to wound the œsophagus of a child. The basket is hinged on to the rod, and when it passes between the piece of money and the posterior wall of the œsophagus the operator draws on it. By this movement the basket expands and receives the piece; but in this position the object is caught in the inferior border of the cricoid cartilage, and extraction becomes impossible, and if the operator is not prudent he will tear through the gullet, an accident that has frequently taken place in the hands of inexperienced operators.

According to M. Caubet, the Kirmisson hook is much more preferable; it is less in size and its edges are blunt and smooth, so that there is no risk of wounding.

The mode of operation is somewhat similar to that of tubage for croup. A sheet is rolled round the child to guarantee immobility. An assistant, seated on a chair, holds him firmly between his knees, while another, standing behind the chair, fixes the head. The mouth is kept open by a large cork placed between the molars. The operator introduces his left finger into the mouth of the patient and guides the hook on it to the posterior wall of the pharynx. The instrument is then introduced, with the hook in front and pushed down. The hook has evidently passed below the object, but the operator must not expect to feel a shock or something abnormal; generally, nothing is felt. The instrument is then drawn up very gently, using little traction movements if necessary, and finally the piece is removed.

This method frequently succeeds, and is exempt from danger when proper precaution is taken.

To resume. Called to a child who swallows a piece of money, the first thing to be done is to bring him under the influence of the radioscope so as to be assured that the body is really in the œsophagus, and at what point. If not more than fifteen days have elapsed since the accident, extraction by the Kirmisson hook is indicated. External œsophagotomy should be reserved for pieces of money impacted for a long time in the œsophagus, and other objects provided with projections.

GERMANY.

Berlin, May 20th, 1906.

At the meeting of the Medical Society, Hr. Orth showed preparations of four cases of

PULMONARY PHTHISIS IN GUINEA-PIGS experimentally produced. They had been infected with human tubercle bacilli, and on examination *post mortem* showed typical appearances of human pulmonary phthisis—nodules, caseation and cavities. The usual form of experimental tuberculosis in animals was on the contrary the miliary. Now, it might be

looked upon as proved that there was an artificially produced pulmonary phthisis, and that one might be set up by the exclusive injection of tubercle bacilli with a mixed form of infection absolutely excluded. The injections were made exclusively subcutaneously or intravenously; the lungs were therefore infected by means of the blood current. Each guinea-pig had its separate cage, so there could have been no infection from one to another. Of the four animals dying from pulmonary consumption, three lingered rather a long time, 150 days, the fourth died on the 53rd day, whilst of animals dying of miliary tuberculosis, some had survived a very long time. The assumption, therefore, that the phthisical changes were the result of long standing disease and only occurred in the course of such lengthened illness was not tenable.

The explanation why this hitherto unobserved form of lung disease appeared in these animals must lie in the individual peculiarities of the animals themselves, and it was notable that all four animals were previously treated for "cold blood" tuberculosis. The idea that in this way the soil was prepared for the development of pulmonary phthisis was not to be rejected without further information.

Hr. Eckstein spoke on

PARAFFIN INJECTIONS AND IMPLANTATIONS IN NOSE AND CHEEK DEFECTS.

He added to his earlier demonstrations on this subject, since the introduction of which the cases had considerably been added to. As before, he still used hard paraffin with a melting point of about 50°C. In this way the occurrence of fatty embolism was excluded, and also the possibility that the injection causes a disturbing pressure; on the other hand, the plastic results obtained had been considerably better. The paraffin was not absorbed, at least in any period that came into practical consideration, unless that once exceptionally it was not deposited in a solid mass, but in fine needles and particles. More recently he had performed implantation of hard paraffin in which all unforeseen accidents were excluded. (A large number of patients and photograms were shown).

Hr. Silberstein recalled a case of amaurosis as a result of the injection of paraffin. He did not believe such an occurrence was excluded by the use of hard paraffin.

Hr. Kirschner had made microscopical examinations in quite a number of cases, and had always found the same condition, viz.: that granulation tissue grew around spicules and needles of paraffin, and these were therefore in process of absorption.

Hr. Joseph would warn them on the ground of his own experiences against too much optimism as regards paraffin injections. He was of opinion that they should only be made use of in cases where the disfigurement was so great that it could not be made greater.

Hr. M. David had observed that both soft and hard paraffin were liable to be absorbed, the latter, however, rather more slowly than the former.

At the Society for Surgery, Hr. Stubenrauch spoke on

PLASTIC OPERATIONS ON THE BILIARY SYSTEM.

and related the following case:—A patient, æt. 46, suddenly took ill in 1904 with rigors, pain and vomiting, and later, jaundice came on; the symptoms then gradually disappeared. On April 27th, 1905, the violent pain returned and an operation was performed on May 1st. There was stenosis of the bile duct, resulting from pancreatitis, on July 27th, a plastic operation was performed for closing the fistula that remained.

Hr. v. Wreden, St. Petersburg, made some observations on

TECHNIQUE.

He said patients often came in an extremely reduced condition. With these he injected 0.015 of morphia, and then performed gastro-enterostomy under cocaine, and used Murphy's button. There was no difficulty. In this way he had operated on 28 cases successfully.

Hr. Heidenhain, Worms, drew attention to the frequent combination of gastric ulcer and apical catarrh—this gave the indication for operation. He had seen some relapses after gastroenterostomy. The patient's freedom from all symptoms was no certain proof of the healing of the ulcers; these might go on in a latent condition. He therefore recommended that the stools should be examined for blood after operation. Only when there was no blood in the stools after coarse feeding without flesh meat, could one say for certain that the ulcer had healed.

Hr. Secfisch, Berlin, contended that gastrolisis rarely attained its object, especially in the case of surface adhesions. Even in the case of banded adhesions the end was rarely attained. In one such case a relapse occurred. He had also often seen relapses after pyloroplasty. In gastroenterostomy he used the suture; if one wished to use Murphy's button, retrocolic gastroenterostomy should be performed, then the button did not drop into the stomach.

Hr. Kuhn, Cassel, remarked emphatically that the extent of the incision in gastroenterostomy was of importance. The opening should not be made too large, as at the time of operation the organ was in a state of contraction. The consequences of too large openings was after-operations, a very small opening was sufficient. He had never seen a *circulus viciosus* after anterior gastroenterostomy.

AUSTRIA.

Vienna, May 20th, 1906.

LOCAL ANÆSTHESIA.

FOR minor operations a safe local anæsthesia has not yet been found. Neumann is now practising in his Oto-Chirurgical operations with a mixture of cocaine and supra-renal extract. He injects this into the bony meatus of the ear below the periosteum, which produces perfect local anæsthesia. Cocaine alone has proved to be a dangerous agent, but whether its safety is assured by the combination with the supra-renal extract is yet a matter of speculation. Both of these agents are proved to be dangerous and how their combination will be safe is a puzzle. Both of them produce emboli, while the extract leaves the walls of the vessel in an atheromatous condition.

TETANUS.

Hochwart gave the Gesellschaft a further explanation of his monograph on 160 cases of tetanus. Since the writing of the monograph he had followed up 55 of the cases in order to obtain a correct record of the subsequent history. Eleven of these cases have since died. No real cause can be attributed for the early demise, as many of the other cases were performing the same duties, of equally good appearance, and possessed similar advantages. It is possible that tetanus has the effect of weakening the constitution, and exposing the system to an easy invasion by the infectious diseases.

Of the remaining 44 we have only a written correspondence to show for eleven of these cases, but the other 37 were personally investigated and examined. Fourteen of these were in perfect health, four were yet doubtful, and the remaining seventeen still suffered from tetanoid attacks, several of them suffering from a chronic form of sickness resembling myxœdema.

Seven of them had the tetanic attacks only in the winter months; others had it in a less degree, which might be designated as latent tetanus, as the characteristic paræsthesia and contractions were present with Chrostek's and Erb's symptoms, the former being a hyperæsthesia of the facial nerve. If the pes anserina be pressed with the finger the facial muscles are thrown into convulsions. Several of these cases have developed large thyroid glands, while one gave birth to a child in this state which had tetanus also after it was born.

Hochwart concluded that these tetanic epidemics in

Vienna are of recent date, as Skóda only records one coming under his personal notice. The incidence of the disease seems to expend itself in one place, then gradually disappear to commence in another place.

Another fact may be learned from these cases, that the prognosis is not so favourable in these cases as formerly asserted. The mortality is heavy, while the chronicity of the disease becomes a serious danger to the patient.

Schrötter thinks that tetanus has previously been confounded with "Shoemakers Cramp" and thus has appeared more frequently than Hochwart believes. For the last 25 years he had devoted considerable time to the examination of protocols engrossed in the records of the hospital and found that Skoda has many similar cases on record. His object in this search was to discover the relation between tabes and syphilis, which were inseparably bound up together. He also found all the symptoms of tetanus mixed up with these cases, which we may infer were genuine tetanus.

Sternberg thought the insurance offices might give some information on the subject from their invalid list, but owing to the decentralising of the "Kranken Kassen" no reliable statistics can be obtained.

Hochwart acknowledged the truth of Schrotter's suggestion, and believed that these cases must have been more frequent than recorded.

HEPATIC PULSATION.

Jagic showed a patient, female, æt. 30, engaged as a saleswoman, with cardiac stenosis of the auriculo-ventricular opening. The patient had suffered from articular rheumatism at one time.

On close examination an almost negative venous pulse was observed in the neck. The liver, however, was enlarged and pulsated; no impulse of the heart could be found to act on the liver; after the apex beat or systole the liver collapsed, and extended over the greater part of the diastole. The pulsation of the liver was synchronous with the small venous pulse in the neck. From these symptoms he diagnosed mitral stenosis with an open foramen ovale. With Volland's double manometer he was able to clearly demonstrate the hepatic pulse.

FROM OUR SPECIAL CORRESPONDENTS AT HOME.

BELFAST.

The sole topic of interest in medical circles in Belfast is the coming appointment of a medical officer of health, and the prospects of the contemplated job for the appointment of an ex-member of the city council being defeated. The Ulster Medical Society has taken a clear and strong line in the matter, and in the resolution published in the report of their meeting last week, which appears in another column, they speak with no uncertain voice. The newspaper correspondence on the subject of the health of the city still rages, and the air is thick with statistics. The chairman of the Public Health Committee Dr. King-Kerr, marshals whole battalions of figures every second or third day, designed to prove that all is well under his loving care, but week after week the registrar-general rudely repeats that Belfast has one of the highest death-rates of any large city in the United Kingdom, and it will take a lot of writing to convince the man in the street that all is well in the face of that fact. Dr. King-Kerr resented greatly some remarks of Dr. Caldwell, the president of the Ulster Medical Society, and in one of his letters to the press made some reference to King Charles's head. Dr. Caldwell neatly retorted that nowadays members of public bodies who obstinately oppose all reform do not lose their heads, but if they are not careful they may possibly lose their seats. It was a very palpable hit, and the one hope is that the city councillors may realise that the electors are in earnest in this matter, and that we may at last see our city with a man able and willing to carry out sweeping reforms in health matters.

LETTERS TO THE EDITOR.

THE MIDWIVES ACT AND THE MEDICAL PROFESSION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—The unfairness of the Midwives Act to the medical profession in its present form is becoming more evident every day. During the last few weeks the Central Midwives' Board has received information respecting the local administration of the Act from almost every area, and an analysis of these returns indicates that thirty-three of the county councils have not yet appointed a medical executive officer. In twenty-eight county borough councils the Medical Officer of Health has been selected to assist the local supervising authority.

The Act contains no provision to secure payment for professional services. Liverpool and Cardiff are the only centres where the councils have made any arrangement for the payment of medical men. As the law stands, practitioners are everywhere responsible for the safety of the poor parturient women during the attendance of midwives practising under legal supervision, and yet out of three hundred and sixty-nine local supervising authorities only two have engaged to secure payment for professional services. Medical men are now summoned to assist in emergencies throughout the country, and many practitioners have to travel miles to aid midwives in cases of danger and difficulty.—I am, Sir, yours truly,

J. WARD COUSINS,
Representative of the Royal College of
Surgeons of England on the Central
Southsea, May 21st, 1906. Midwives Board.

THE TAXATION OF PROFESSIONAL INCOMES.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—I have perused your article headed "The Taxation of Professional Incomes." It is indeed well that the select Committee of the House of Commons is going to consider the question of differentiation and the advisability of taxing the recipient of an earned income at a lower rate than the person who receives his income spontaneously.

May I, however, be permitted to sound a note of warning to the profession? In 1861 a Committee considered this question and in my belief the result adverse to differentiation was brought about in a large part by the competitive evidence of professional witnesses, medical witnesses among others. Now if differentiation is to come, it is necessary that fine distinctions should not be introduced and that there should be one cleavage between earned and unearned incomes, and one cleavage only. If strong evidence is given in favour of preferring the recipient of a professional income to the recipient of a commercial income; the recipient of an income from brain to him who receives from the joint action of brain and capital; of preferring the person whose professional education has been expensive to him whose education has ceased with his school days, then I take it differentiation will be again shelved.

I believe that the Committee will propose the adoption of a system of differentiation, always providing that these cross distinctions are not introduced to complicate the system and make it, as they undoubtedly would, absolutely impracticable. If the profession will be satisfied that the earned incomes of its members be taxed at a rate considerably lower than the unearned incomes of its members and of other persons, then it is certainly possible to produce a scheme which will confer this benefit, and the benefit should be sufficiently marked to satisfy the workers.

I am, Sir, yours truly,

T. HALLETT FRY.

ROLLESTON ON MITRAL STENOSIS.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—I have read Dr. Rolleston's "Clinical Lecture" on this subject, in your issue of April 18th, with very

great interest, as we get a good many cases of the kind out here. What perhaps interested me most was his clear definition of the physical signs and murmurs by which to distinguish between Mitral Stenosis, Mitral Regurgitation, and Aortic Regurgitation. In this lecture the author tells us that the patient came into hospital with acute articular rheumatism, which rapidly yielded to treatment by the salicylates and carbonate of soda; but I was disappointed not to find any reference or suggestion as to the treatment of mitral stenosis, especially in its earlier stages. Could he favour your readers with suggestions under this head doubtless others would be grateful beside,—

Yours very truly,

A COLONIAL PRACTITIONER.

Capetown.

Coronation Fund for Nurses in Ireland.

THE annual general meeting in connection with King Edward VII.'s National Coronation Fund for Nurses in Ireland was held on May 14th. Her Excellency the Countess of Aberdeen, patroness of the Society, presided.

The annual report stated that the number of nurses and probationer nurses now registered as members is 177. The number of new members who joined since last meeting is 17. It is to be regretted that as yet but few nurses seem to appreciate the useful work that the Society is doing. During the last year (ending May, 1906) three members applied to the Society for help and each received a grant. The balance sheet shows that the Society is very economically managed. The Council entertain the strong hope that this institution which is the only one of the kind in Ireland, will grow in usefulness every year, and be beneficial to the body of the nurses of the sick working at their profession in Ireland.

Sir A. Chance proposed, and Sir W. Smyly seconded the adoption of the report. After the Council for the coming year had been elected, Sir Andrew Reed proposed, and Sir William Thomson seconded, a vote of thanks to Her Excellency, which was carried amid applause.

Her Excellency, in reply, said it gave her great pleasure to be there and identify herself with the work of the Society. She thought that nurses should show their belief in the Society by joining it. Her Excellency suggested to the Council to appeal to nurses not alone to join for the sake of themselves, but also for the sake of their sister nurses. She trusted that next year there would be a large increase in the membership.

The proceedings then terminated.

Royal College of Surgeons of Edinburgh.

At a meeting of the College held on the 16th inst., the following gentlemen, having passed the requisite examinations, were admitted ordinary Fellows:—Hirjee Nowroji Anklesaria, L.M. and S., Bombay; Charles Mackie Begg, M.D., M.R.C.P.E., Dunedin; Reginald Bryson, L.R.C.P. and S.E., Captain I.S.; John Burdon-Cooper, M.D., Bournemouth; Robert Sturgeon Cocke, M.R.C.S.Eng., London, W.; James Mathieson Kirkness, M.B., Ch.B., Edinburgh; Siavax Byramji Mehta, L.M. and S., Bombay; Victor Edgar Sorapure, M.B., Ch.B., Liverpool.

At the same meeting Dr. Robert McKenzie Johnston, 2, Drumshugh Gardens, Edinburgh, was appointed Secretary and Treasurer, and Dr. James William Beeman Hodsdon, 6, Chester Street, Edinburgh, was appointed representative of the College on the General Medical Council for five years from June 21st next.

The Medal and set of books presented to the College by Colonel William Lorimer Bathgate, in memory of his late father, William McPhune Bathgate, F.R.C.S.Ed., Lecturer on Materia Medica in the Extra Academical School was awarded after the usual competitive written examination in Materia Medica, etc., to Mr. James Hay Johnston, 18, Plewlands Terrace, Edinburgh.

MEDICAL NEWS IN BRIEF.

The Medical Society of London.

A LARGE number of Fellows and visitors attended the *Conversazione* of the Medical Society of London on Monday, May 21st, when, after a reception by the President, Sir Lauder Brunton, F.R.S., a very interesting oration was given by Professor Kocher of Berne, under the title of "Some Contributions to the Pathology of the Thyroid Gland." The Professor, amongst other remarks, stated that he preferred the term "heart goitre" to that of "exophthalmic goitre," as tachycardia comes on before the exophthalmic symptoms. He exhibited a table of 165 cases on which he had operated; these he divided into three series. The first series, comprising ten cases, he called *struma vasculosa* and beginning Basedow's disease with mostly local symptoms; all of the ten were absolutely cured by the operation. The second series of sixty cases he designated *struma basedo-coificata*, a milder form of Basedow's disease developed on a pre-existing goitre; of these two were greatly ameliorated, and forty-nine cured. The third series comprising 106 cases he described as *struma Basedowi*, or typical Basedow's disease; of these sixty-two were cured, nine greatly ameliorated, seventeen ameliorated, and nine he obtained no further news of, and nine died. Therefore, in summing up, the total mortality was 5 per cent., immediate healing 95 per cent., no later news 10 per cent., died later 2 per cent., improved 10 per cent., greatly improved 7 per cent., cured 8 per cent.

Sir Victor Horsley proposed a vote of thanks to Professor Kocher in a few graceful words, in which he alluded to King, of Guys, who a century ago had done so much to advance this branch of surgery.

Sir Felix Semon seconded, and the vote of thanks was carried by acclamation. A *conversazione* followed, a pleasant feature of which was the music of the Blue Viennese Orchestra.

Banquet of the Royal College of Surgeons of England.

THE President (Mr. John Tweedy) the Vice-Presidents Mr. H. T. Butlin and Mr. Edmund Owen) and the Council of the Royal College of Surgeons entertained at dinner on Friday last the Norwegian Minister, Dr. Nansen; Baron Takaki, F.R.C.S., Field-Marshal Sir George White, Sir Edward Fry, Lord Justice Cozens-Hardy, Sir Joseph Dimsdale, Sir R. Douglas Powell, Sir George Young, Vice-Admiral W. H. Henderson, the Hon. John Collier, the Master of the Temple, Sir Alexander Binnie, Sir Thomas Smith, Sir Frederick Treves, Sir Richard H. Charles, the Masters of the Mercers, Grocers, Drapers, Clothworkers, Apothecaries, Armourers and Brasiers, Leathersellers and Saddlers Companies, Capt. de Courcy Hamilton, R.N., Mr. Almeric Fitzroy, Mr. Jonathan Hutchinson, Mr. Thomas Bryant, Professor Percy Frankland, Professor Sims Woodhead, Mr. Giraud Browning, Mr. Sidney Lee, Mr. H. M. Ellis, Surg.-General Keogh, Surg.-Gen. Branfoot, and the Rev. J. L. Evans. The members of the Council present on the occasion were Mr. Langton, Professor Howard Marsh, Mr. Morris, Mr. Mayo Robson, Mr. Godlee, Mr. Watson Cheyne, Mr. Page, Mr. Ward Cousins, Mr. Pearce Gould, Mr. Morgan, Mr. Clutton, Mr. Moullin, Mr. Dent, Mr. Makins, Mr. Eve, Mr. Bowlby, Mr. Golding-Bird, Mr. Cripps, with Professor Stewart (Conservator), and Mr. Cowell (Secretary). After the dinner the President presented the honorary gold medal of the College to Lieut.-Col. Sir Richard Havelock Charles, I.M.S., K.C.V.O.

Medical Scholarships in Trinity College, Dublin.

THE Board of Trinity College, Dublin, applied during the past week to the Court of Chancery in Ireland to obtain the sanction of the Court to certain changes which they desired to make in the regulations governing studentship in medicine awarded by them under the will of Jane Begley, who left the sum of some £5,000 for the purpose of awarding such studentships. The

original provisions of the will contained clauses based to a large extent on the fact that the medical curriculum at that time covered a period of four years, and it has now been found that the adoption of the five years system rendered the strict carrying out of these clauses prejudicial to the satisfactory administration of the trust. The Board accordingly applied to have the necessary alterations made and suggested a scheme whereby the studentships should be open to all students who had passed the senior freshman's final examination either before or after the date on which they enter the school of physic, a preference to be given in the discretion of the Provost and Senior Fellows to students of longer standing in their Arts course. Judge Barton said the scheme was an excellent one, and he referred it to Chambers to have same settled.

Drug Contracts in England and in Ireland.

IN the House of Commons on Wednesday last, Mr. Chas. Devlin asked the President of the Local Government Board whether he was aware that several English Boards of Guardians had refused to consider tenders of Irish chemical and drug companies for medicine supplies and had informed such Irish companies that the contracts for such goods are invariably given to local firms; and whether, in view of the fact that the Local Government Board of Ireland insist that Irish Boards of Guardians must consider English as well as Irish tenders in such matters, he would take such steps as would place Irish firms on the same footing as English firms. Mr. Burns replied that he believed that some Boards of Guardians in England and Wales only considered tenders from local firms, but he was not aware of any case in which a distinction had been made between tenders from Irish firms and tenders from other persons not belonging to the locality. It did not appear to him to be desirable that a Board of Guardians should only consider local tenders, but at present it did not seem to him to be necessary to alter the existing regulations on the subject. Will the Irish Local Government please note this? "What's yours is mine, what's mine is my own" is not a very satisfactory answer in such cases.

Hall v. Fenton and Another.

IN this case in the King's Bench Division, before Mr. Justice Phillimore and a special jury, the plaintiff, Mrs. R. J. Hall, sued the defendants, Dr. W. H. Fenton, senior physician at the Chelsea Hospital for Women, and Dr. S. J. Cameron, formerly house surgeon at the same hospital, to recover damages for injuries sustained by her owing to the alleged negligence of the defendants. The defendants denied liability. It appeared that in June 10th, 1903, the plaintiff was admitted into the Chelsea Hospital for operation. She was placed under anæsthetics, and the operation was successfully performed by Dr. Fenton. The negligence alleged by the plaintiff was that she was not informed that an instrument inserted when she was unconscious would require to be removed in two months' time, and that she was not told to return to the hospital for that purpose. As a result, according to the plaintiff's case, the instrument was not discovered until some 18 months afterwards, and had done her serious injury. On behalf of the defendants evidence was given to the effect that the plaintiff was instructed to present herself as an out-patient two months after the operation, and that by the hospital routine it was impossible that she could have been allowed to leave without receiving such a direction. The jury returned a verdict for the defendants, adding a rider to the effect that they thought it was desirable that in cases such as the present written instructions should be given to the patients by the hospital authorities if they were required to return.—His Lordship said he thought the suggestion was a very wise one, among other reasons for the protection of the hospital authorities in case of questions arising as in the present instance.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS. ENGLISH AND FOREIGN.

Specially Compiled for THE MEDICAL PRESS AND CIRCULAR.

RECENT MEDICAL LITERATURE.

Microscopic Stagnation as Sign of Cancer.—Zeigler (*Zeit. f. Klin. Med.*, Berlin, 1906) announces that the first and sometimes the only symptom of cancer in the lesser curvature of the stomach is the discovery of minute remnants of food at a time when the stomach should be empty. This retention of microscopic relics of the stomach contents is characteristic of cancer when, after evacuation of the stomach of the macroscopic remains of the food, microscopic relics persist to the next ingestion of food, not merely for an hour afterwards. This daily finding persisted for months in certain patients. The retention is to be distinguished from the old conception of stagnation of stomach contents not only quantitatively but qualitatively as well. As a rule, it is not even the precursor of the other. In the limited and persistent form to which Zeigler refers, it occurs only under certain conditions, that is, when part of the stomach wall in the lesser curvature or in its vicinity has become rigid by induration and has lost its power of peristalsis. This is always the case in malignant disease. The presence of lactic acid bacilli is an early sign of retention, even of these microscopic amounts, and their resistance to lavage is an important point in the indirect diagnosis of cancer. In patients whose stomachs were apparently free from food at latest two and a half hours after a test breakfast without milk, and seven hours after a test meal, he examined the stomach an hour or so later and again the next morning fasting. The little mass of mucus found in the opening in the tip of the sound was then examined and found to contain evidences of the microscopic stagnation. They are examined for bacilli, starch grains, meat fibres and fat droplets. Leucocytes are also liable to be present, and suggest the point where the stagnation of the microscopic relics takes place. These findings can be encountered for weeks and months without other symptoms, if the cancer does not happen to develop where characteristic symptoms must follow. In his typical cases of this isolated microscopic retention there were no traces of blood, no tumefaction, cachexia, ascites, nor glandular swelling. At most, only a family tendency, anæmia and the peculiar pain in the back were observed. The microscopic stagnation persisted unmodified, even after rinsing the stomach with an infusion of tea or hops or a solution of silver nitrate. In non-cancer cases there is none of this microscopic retention; the stagnation is either macroscopic or entirely absent. The lactic acid bacilli are also readily banished by one or two rinsings of the stomach. Their resistance to rinsings is characteristic of a malignant process. D.

Serum Treatment of Typhoid Fever.—Brunon and Josias (*Bull. de l'Acad. de Med.*, Paris, 1906) report the results of the use of antityphoid serum in 100 children, æt. from 3 to 16. The typhoid mortality in their service with other methods of treatment was 17 per cent., but under serotherapy it dropped to 3 per cent. In the fatal cases the serotherapy had not been applied until the 15th, 16th, and 38th days respectively. It has an unmistakable action on the disease, modifying and attenuating it as a whole, shortening its duration, reducing the chances for complications, and the mortality. They are convinced that the outlook for a typhoid patient is very much better when the serum is injected as an adjuvant to the usual measures. It is absolutely harmless. D.

Mercurial Inunctions and their Action on Urinary Organs.—Kleineberger (*Zeit. f. Klin. Med.*, Berlin, 1906) describes the findings in thirty-seven cases after mercurial inunctions. They prove that this method of treatment is not so harmless as generally supposed.

Changes in the urine develop almost constantly and are due to the action of the mercury on the secreting parenchyma of the kidneys. As this effect occurs early and after small doses, when manifest albuminuria develops the kidneys are already severely affected and general mercurial intoxication installed. As mercury is such an efficient remedy, we can not dispense with it, he adds, but we should not give it for a long time and without sufficient grounds in chronic nephritis, and even in that case it should be suspended if indications of serious albuminuria develop and casts are found in the urine. D.

Chronic Latent Appendicitis.—Reclus calls attention (*Gaz. des Hôpitaux*, 1905, No. 119) to an important clinical form of appendicitis of a chronic nature, which is characterised by thickening of the cæcum, tympany, pain on compression of the appendix, and increase in size of the appendix which can often be made out by careful palpation of the right iliac fossa. Constipation accompanies, and is perhaps the cause of the inflammatory condition, and entero-colitis or membranous colitis may also co-exist. He advises a systematic examination of the appendix in all cases of chronic dyspepsia, in all cases of chronic diarrhœa, and in children who suffer from vomiting or who complain of nausea after taking meat or fatty foods, as all the above symptoms may be the result of a chronic appendicitis. Further symptoms are nervousness, irritability, fatigue after slight exertion, insomnia and general neurasthenic signs. Nutrition also suffers, and there may even be occasional fever resulting from toxic absorption. The only treatment is complete extirpation of the appendix, and this is usually followed by most favourable results, the entero-colitis improving and all the symptoms becoming ameliorated. M.

Acute Rheumatic Arteritis.—Barié reports a case (*Presse Méd.*, 1905, No. 24) of severe pain and increased pulsation in the brachial artery occurring in a case of acute joint rheumatism, and discusses generally the cases of acute arteritis occurring in this disease, and which, according to French writers, are a frequent complication of it. They find it not only in the aorta, but also in the arteries of the limbs and in the coronary vessels. The first symptom complained of is pain, which is situated along the entire length of the inflamed vessel, and is often of great severity; then one finds a greatly increased pulsation over the painful area, which is apparently produced by a general dilatation of the vessel; and, lastly, various abnormal sensory disturbances appear, and there is pain on pressure along the course of the vessel. In those varieties in which complete obliteration does not occur, and where there is only a limited inflammation of the vessel wall, healing rapidly takes place. Should obliteration occur all the signs of local anæmia become manifest, and may even be succeeded by local gangrene. M.

Atypical Leukæmia with Osteo-Sclerosis.—Rauwoerck and Moritz record a case of a woman, æt. 37, who was admitted to hospital complaining of an enlargement of the abdomen, which she had first noticed six years previously. She was found to have a large splenic tumour, slightly enlarged lymph glands, 6 per cent. hæmoglobin, 3½ million red blood corpuscles, 7,000 white corpuscles, poikilo cytosis, and numerous nucleated red cells. A differential count of the white cells showed about 18 per cent. lymphocytes, 65 per cent. leucocytes, 2 to 4 per cent. myelocytes, 6 to 13 per cent. eosinophiles, and 5 per cent. large mononuclear cells. The patient died of sepsis after extirpation of the spleen; the autopsy showed sclerosis of most of

the bones, myeloid hyperplasia of the marrow and of the spleen, and giant cell development in lymph glands, liver, and kidneys. The case belongs, therefore, to the very rare group described by Pappenheim as myeloid pseudo-leukæmia. With regard to the osteo sclerosis, cases have been described by von Henck, von Jacksh, and others, all of which agreed in showing bone marrow alterations, and some increases in the number of myelocytes and transitional cells in the blood. Occasionally the osteo-sclerosis itself has only been very slightly marked.

M.

Pathology of Raynaud's Disease.—Strauss (*Archiv. Psych.*, Bd. 39, I.), records a case of Raynaud's disease with necropsy report. The patient was a woman, æt. 26, who for six years had suffered from various, symptoms of disseminated sclerosis, and in whom four fingers of the left hand and two of the right, along with several toes, presented a cyanotic appearance. Finally the fingers of the left hand became gangrenous. The *post mortem* showed the presence of multiple sclerosis. Besides numerous foci in the medulla, the superior olive was found to be especially involved, though the axis cylinders and ganglion cells were uninjured. In the capillaries above the gangrenous fingers hyaline thrombi were present. An inflammatory condition in the controlling vasomotor centre in the medulla pointed to the disease being an angio-spastic gangrene. The ischæmia or cyanosis produced by the spasm is followed as a later consequence by gangrene from deficient nutritive supply to the part. Strauss, therefore, asserts that Raynaud's disease is not a trophoneurosis, but an angioneurosis which may develop either as an independent disease or may be engrafted on other disease of the nervous system.

M.

Tachycardia Associated with Simple Goitre.—Zeska (*Centralbl. f. die Med. Wissensch.*, 1906, No. XI.) draws attention to the fact that various cardiac disturbances may be met with in association with thyroid diseases, which are in no way identical with Graves' disease, and which up to this have attracted very little attention. He says that goitrous patients, especially young persons, have as a rule a rapid action of the heart, which in certain cases may become true tachycardia. This is especially the case in deep-lying goitres. Such patients frequently also complain of palpitation, a symptom which is often regarded as merely a part of the general anæmia from which they are also suffering. Cure of the anæmia, however, leaves the cardiac symptoms unabated, while on the other hand excision of the goitre usually leads to rapid relief. The relation of the goitre to these symptoms is easily understood, when it is remembered that other neck tumours can produce similar effects by pressure upon the vagus or sympathetic. In fact, the symptoms are in no way specifically connected with the functions of the thyroid, but are to be regarded as pressure effects. "Strumous tachycardia," as the condition may be named, he regards as a definite indication for operation.

M.

The Treatment of Diabetes Mellitus.—Williamson (*The Med. Chronicle*, May, 1906) relates three cases illustrating the value of aspirin in the treatment of this disease. The first case was that of a woman, æt. 52, who on admission to hospital was passing 54 ozs. of urine per diem with 22 gr. of sugar to the ounce. For the first ten days the patient was kept on ordinary hospital diet which included 11 oz. of white bread daily; no drugs were given except a little peppermint water three times a day. During the next three weeks experiments were made with various articles of diet, but five weeks after admission to hospital the condition of the patient was practically unchanged. The treatment with aspirin was then begun and 15 grs. of the drug were given three times a day, the former diet being maintained unchanged. In four days the total quantity of sugar excreted per diem had fallen from 910 grs. to 106 grs. Twenty days later the total quantity of sugar excreted in twenty-four hours was

116 grs. Five of the 11 ozs. of white bread allowed daily were then replaced by 5 ozs. of gluten bread, and the next day the sugar excretion was reduced to 49 grs. Three days later there was no reaction for sugar with Fehling's solution. In the second case treatment by aspirin was followed by a reduction in the daily sugar excretion from 1,564 to 402 grains, and when the aspirin was discontinued the daily excretion of sugar increased again to 1,586 grs. In the last case, that of a patient who was passing 688 grs. of sugar daily on admission to hospital, after treatment for three weeks with aspirin the sugar had completely disappeared from the urine. Dr. Williamson says: "In all these cases the disease was of a mild form. In severe forms of diabetes aspirin has often little influence. It is important that alkaline water or milk should not be taken just after the aspirin. One drop of lemon juice in a little water should be taken with each dose of the aspirin."

K.

Lumbar Puncture—Kopetzky (*Amer. Journ. Med. Sciences*, April, 1906) discusses this procedure as an aid to diagnosis, as a therapeutic measure, and for the production of anæsthesia. For diagnostic purposes the essential points to be considered in the examination of cerebral fluid are: The pressure under which the liquid is obtained; its colouration; its bacteriology; its cytology; its chemical examination; its cryoscopic examination. Of these various methods of examination by far the most important are the bacteriological and cytological examination. The diagnostic importance of pressure is on the whole a limited and secondary one, while so much variability in the colouration of the fluid has been observed that little faith can be placed on the data obtained by this method. Neither the chemical nor cryoscopic examination of the fluid has as yet yielded much which is of practical value for the purposes of diagnosis. The bacteriological and cytological examination is often of great value as an aid to diagnosis. It must be remembered, however, that in this, as in other cases, negative results are of nothing like so great importance as are positive results. The data obtained must always be considered with the clinical evidence of the disease, for it is only in some cases where the bacteriological findings have been positive, such as in cerebro-spinal meningitis, that a certain diagnosis can be made by the method alone. As a therapeutic measure the method may be used either for the introduction of medicaments into the spinal canal or for the relieving of pressure by the withdrawal of excessive amounts of fluid. Some success has attended the introduction of antitetanic serum into the spinal canal, but even in this case the results are by no means universally favourable, and in the use of other drugs the method has been very disappointing. As regards the second therapeutic principle the idea of producing a favourable therapeutic result by the withdrawal of the spinal fluid, there is a wide divergence of opinion, though on the whole it would appear to be favourable. On this point judgment must still be reserved for fuller knowledge. As a procedure for the production of anæsthesia it suffices to say "that the enthusiastic endorsement accorded to it at its introduction into this country some few years ago is on the wane. It is still a valuable procedure in selected cases, but many operators both here and abroad have abandoned it and condemned it."

K.

NOTE.—A summary will appear each week in the following sequence:—

- (1) "Recent Medical Literature."
- (2) "Recent Surgical Literature."
- (3) "Recent Gynæcological and Obstetrical Literature."
- (4) "The Recent Literature of Physiology and Pathology."

NOTICES TO CORRESPONDENTS, &c.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

REPRINTS.—Reprints of articles appearing in this journal can be had at a reduced rate providing authors give notice to the Publisher or Printer before the type has been distributed. This should be done when returning proofs.

ORIGINAL ARTICLES OR LETTERS intended for publication should be written on one side of the paper only, and must be authenticated with the name and address of the writer, not necessarily for publication but as evidence of identity.

CONTRIBUTORS are kindly requested to send their communications if resident in England or the Colonies, to the Editor at the London office; if resident in Ireland, to the Dublin office, in order to save time in reforwarding from office to office. When sending subscriptions the same rule applies as to office; these should be addressed to the Publisher.

MIDWIVES AS WITNESSES.

A CORRESPONDENT writes us from York as follows:—"Dear Sir,—I have been asked if a registered midwife, when called to an inquest on a child three months old, is entitled to a fee as a witness. The said midwife had delivered the mother of the infant in question, and put in the usual post-partum attendance, but had not seen the infant for six weeks before its sudden death, and then only in a casual way. The courtesy of your reply will oblige.—D.M.T."—[The midwife would be entitled to attend, in our opinion, as an ordinary witness, if required to do so by the coroner. It is obvious, however, that she could offer evidence only in general terms as to the nature of the confinement and the healthy condition or otherwise of the child. The only expert opinion of any value regarding the cause of death, under the circumstances described, would be that of a qualified medical witness.—ED., M.P. and C.]

DERMATOLOGIST (Brighton).—There are specially named instruments sold for the purpose, but you will find ordinary forceps and scalpels quite sufficient. Norman Walker's book is sound and practical.

THE EMPLOYERS LIABILITY BILL AND MEDICAL PRACTITIONERS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR.—Now that the above Bill is before Parliament I would suggest, that the different divisions and branches of the B.M.A., and other medical societies take immediate action, so that all medical practitioners shall be included in the above Bill. Almost all the illnesses and accidents which attack us come through our dangerous occupation; while each year finds the majority less able financially to provide against sickness, accident, infirmity, and old age. I would suggest immediate action.

Liverpool, May 15th, 1906.

ROBERT R. RENTOUL.

IS CARDIFF OVER-DOCTORED?

Is Cardiff over-doctored? Mr. James Matthews, the Newport librarian, replies, "Emphatically, yes!" "Cardiff," he says, "has 128 doctors, and Newport has only 33. If Cardiff has three times the population of Newport, then Cardiff has, pro rate, too many doctors by 27. This testifies to the fact that the people of Newport do not take quite so much physic as the good people of Cardiff, and that Newport must be a very healthy place to live in." There is a fatal flaw in Mr. Matthews's argument. Pro rata, Newport has twice as many undertakers as Cardiff!—*Western Mail*.

VERONICA (Bolton).—Write to the matron of one of the large London hospitals. If you like we can give you particulars as to paying probationers.

KING'S COLLEGE, LONDON.

The enterprise of modern hospital managers is boundless. King's College, London, seems about to emerge into a magnificent maturity from its former comparative chrysalis-like obscurity. Seven acres of ground have been presented by Mr. W. F. D. Smith, M.P., for the site of the new hospital. The number of beds will be raised from 224 to 600. This week a great Elizabethan fair and fête is being held, on behalf of the building fund, in Lincoln's Inn.

Meetings of the Societies, Lectures, &c.

WEDNESDAY, MAY 23rd.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chenies Street, W.C.).—4 p.m. Mr. J. Berry: Clinique. (Surgical). 5.15 p.m. Lecture:—Dr. A. Mackenzie: The Treatment of Acute Pneumonia.

THURSDAY, MAY 24th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chenies Street, W.C.).—4 p.m. Mr. Hutchinson: Clinique. (Surgical). 5.15 p.m. Lecture:—Dr. P. Stewart: Tropic Nervous Diseases.

NORTH-EAST LONDON POST-GRADUATE COLLEGE (Tottenham Hospital, N.).—4.30 p.m. Dr. Arthur Giles: Lecture on Obstructed Labour.

FRIDAY, MAY 25th.

CLINICAL SOCIETY OF LONDON (20 Hanover Square, W.).—8.30 p.m. Papers.—Dr. F. Hawkins: Case of Thrombosis of the Abdominal Aorta.—Dr. C. R. Box: A Series of Cases in which Pulmonary Embolism was Due to Displacement of Pulmonary Thrombosis.—Dr. F. P. Weber: Acute Dilatation (Atony) of the Stomach and Intestines connected with Pneumonia and Pericarditis.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chenies Street, W.C.).—4 p.m. Dr. St. Clair Thompson: Clinique. (Throat).

TUESDAY, MAY 22nd.

NORTH-EAST LONDON POST-GRADUATE COLLEGE (Tottenham Hospital, N.).—4.30 p.m. Lecture.—Mr. Walter Edmunds: New Growths of the Intestinal Tract with their Treatment.

Vacancies.

Huddersfield Infirmary.—Senior Male House Surgeon. Salary £20 per annum, with board, residence, and washing. Applications to Mr. J. Bate, Secretary, Infirmary, Huddersfield.

London County Asylum, Horton, Epsom, Surrey.—Junior Assistant Medical Officer. Salary £150 per annum, with board, furnished apartments, and washing. Applications to H. F. Keene, Clerk of the Asylums Committee, Asylums Committee Office, 6 Watertown Place, E.W.

Parish of Paddington.—District Medical Officer. Salary £100 per annum. Applications to Henry F. Aveling, Clerk to the Guardians, Guardians' Offices, 313-319 Harrow Road, W.

Hull Royal Infirmary.—House Physician. Salary £100 per annum, with board and furnished apartments. Applications to the Chairman of the House Committee.

Cornwall County Asylum, Bodmin.—Third Assistant Medical Officer. Salary £135 per annum, with board, furnished apartments, washing, &c. Applications to the Medical Superintendent.

Radcliffe Infirmary and County Hospital, Oxford.—Secretary Superintendent. Salary £150 a year. Applications to the Treasurer at the Radcliffe Infirmary.

Perth District Asylum, Murthly.—Assistant Physician. Salary £120 per annum, with board and residence. Applications to Dr. Bruce, Phys. Supt., Murthly, Perthshire.

Appointments.

ARMOUR, DONALD, M.B. Toronto, M.R.C.P. Lond., F.R.C.S. Eng., Assistant Surgeon to the National Hospital for the Paralysed and Epileptic.

BARNARD, ANNIE T., M.B., B.S. Lond., Refractionist to the Royal Eye Hospital, Southwark, S.E.

BLAKENY, JOHN HENRY, L.R.C.P. Lond., M.R.C.S., Public Vaccinator for the No. 1 District by the Cheltenham Board of Guardians.

DONALD, DAVID, L.R.C.P. and S. Edin., L.F.P.A. Glasg., Honorary Medical Officer to the Aldershot Hospital.

FENTON, W. J., M.B. Camb., M.R.C.P. Lond., Assistant Physician to Charing Cross Hospital.

GILES, A. E., F.R.C.S. Edin., M.D. Vict., Surgeon to In-patients at the Chelsea Hospital for Women.

MCHOU, JAMES, M.B., Ch.B. Glasg., House Surgeon at the Royal Eye Hospital, Southwark, S.E.

REYS, OWEN LEWELLYN, M.B., Ch.B. Edin., Clinical Assistant to the Electrical Department at Cardiff Infirmary.

ROB, WILLIAM FRANCIS, L.R.C.P. and S. Edin., Clinical Assistant to the Royal Hospital for Diseases of the Chest, City Road.

STEWART, PURVIS, M.D., F.R.C.P. Lond., Physician to the Italian Hospital, London, W.C.

Births.

CAMPBELL.—On May 19th, the wife of P. E. Campbell, M.B., C.M., Medical Superintendent, Caterham Asylum, of a daughter.

SMITH.—On May 17th, at High Down, Hindhead, the wife of Gilbert Smith, M.D., F.R.C.S., of a son.

SMITH.—On May 7th, at Mossel Bay, S. Africa, to Alste and Douglas Wilberforce Smith, M.B., B.S. Lond., a daughter.

STOKES.—On May 15th, at 43 Clapham Road, London, the wife of Ronald M. Stokes, L.R.C.P. and S. Edin., &c., of a son.

UNITT.—On May 13th, at Quorn, Leicestershire, the wife of James A. Unitt, M.R.C.S., of a daughter.

WIGGINS.—On May 15th, at Worthing, the wife of Henry Wiggins, M.R.C.S. Eng., L.R.C.P. Lond., of a daughter.

Marriages.

CONWAY—LEGGE-NEWCORNER.—James Conway, L.R.C.P., L.R.C.S.I., late Captain R.A.M.C., son of Captain Conway, Lahore, India, to Georgina, widow of the late Alfred John Legge-Newcombe, of Devonport.

Deaths.

GREGORY SMITH.—On May 17th, at 24, Lingsfield Road, Wimbledon, Harriet, widow of John Gregory Smith, F.R.C.S. Eng., aged 87.

RANSOME.—On May 14th, at "Sunnyhurst," Bournemouth, Lucy Elizabeth, wife of Arthur Ransome, M.D., F.R.S.

The Medical Press and Circular.

Published every Wednesday morning. Price 5d. Post free, 5id.

SUBSCRIPTIONS.

Subscriptions may commence at any period of the year. If paid in advance the cost is only 2s. per annum, post free. An edition is printed on thin plate paper for foreign and Colonial subscribers at 2s. per annum, post free, if paid in advance, or 2s. 6d. credit rate.

ADVERTISEMENTS.

FOR ONE INSERTION.—Whole Page, 2s 0s. 0d.; Half Page, 2s 10s. 0d.; Quarter Page, 1s 8s. 0d.; One-eighth, 1s. 6d. Considerable Reductions from the foregoing scale are made when an order is given for a series of insertions. Terms on application to the Publisher.

Small announcements of Practices, Assistantcies, Vacancies, Books, &c.—Seven lines or under (70 words), 4s. 6d. per insertion; 6d. per line beyond.

THE MEDICAL PRESS AND CIRCULAR.

VOL. CXXXII.

WEDNESDAY, MAY 30, 1906.

No. 22.

NOTES AND COMMENTS.

A Coroner on Hospitals.

THE good folk of Birmingham have been for some weeks past thrown into a quandary as to the management of their general hospital. The father of a child that died from severe burns made some extraordinary statements at an inquest. He said that the little patient was not seen for forty minutes after going to the hospital, and not dressed for forty minutes later again. Mr. Coroner Bradley, who heard the case, appears to have accepted the implied censure of the medical staff off-hand, and to have assumed gross negligence on their part. His proper course, in view of the seriousness of the allegations, would have been to adjourn the inquiry so as to permit of an explanation from the other side. The latter has since been made, and puts the affair in quite another light. It throws, indeed, the whole of the blame upon the distraught father, who refused to leave his child in the hospital wards, although warned of the critical nature of the child's condition. All this pertinent evidence, however, should have been placed before the jury before they arrived at their verdict. We presume Mr. Bradley is a lawyer, which makes this bandying with *ex-parte* evidence the more inexplicable. Meanwhile, his action in the matter has done a great injury to a worthy public charity.

His View of Hospital Aid.

THE most extraordinary feature of Mr. Bradley's now notorious inquest was his remark to the mother of the deceased child to the effect: "If you were not satisfied with the attention you got from a charity, you could have gone elsewhere." This crystallises the position, so far as the relations of that section of the public which supplies the patients to the hospitals is concerned. They have long ceased to regard the relief afforded by medical charities as a favour, and look upon it as a right. The result is not a little misleading. The poorer classes, the newspapers and the public have come to look upon the system of medical charities as one which must be maintained at a high and often, according to our view, an impossible standard. From this point of view there is something to be said for the view of Mr. Bradley, although at first sight it seems to be inexcusably cynical. If the "elsewhere" of his dictum were interpreted on ordinary principles of justice, it would often mean that the hospital patient

should be employing and paying for the services of a private medical practitioner. To that extent we are with Mr. Bradley.

A Breach of Bar Etiquette.

THE Bar of England is governed, as everyone knows, by unwritten laws that are no less stringent than those which regulate, more or less, the medical profession. With barristers, for instance, direct advertising is anathema, constituting an ethical offence of an extremely gross nature. The Inns of Court have recently been considerably fluttered by the action of a member of the Middle Temple, who is said to have issued to some of the metropolitan mayors a circular letter marked "confidential," intimating that he had commenced practice at the Bar in connection with work of a parliamentary, municipal and public health nature, and requesting those addressed to communicate that fact to town clerks. This matter having come before the benchers of the Middle Temple, they ordered that the offender should be severely censured, and be excluded for a year from hall, library and garden of his Inn. The resolution, to the outside world, will sound somewhat like the terrible sentence framed by the Abbot upon the jackdaw of Rheims. For all that, it is one of the most serious catastrophies that could mar a barrister's professional career. The wonder is that in so closely-guarded a precinct any member should have had the temerity to send out a circular letter of the kind alluded to.

Professor W. R. Smith on the Subject.

THERE is a sequel to the Middle Temple affair. A week ago, at the meeting of the Holborn Council, a member said he wished to draw attention to a matter closely touching the honour of the Mayor and of the Council. The Mayor of the body in question is Professor W. R. Smith, a medical man, who holds a Chair at King's College and is a member of the Middle Temple. He ruled out of order the councillor who drew attention to the legal censure, and intimated his opinion that an explanation would be forthcoming. He suggested that the proper course would be to refer the whole thing to the Holborn Parliamentary Committee. The councillor thereupon gave notice of his intention at the next meeting of the Council to move: "That a small committee be formed to consider the circular sent by the Mayor to the metropolitan

mayors; and the action of the Benchers of the Middle Temple, as reported in the public press, and the circumstances connected therewith, and to report whether the action of the Mayor in the matter calls for the censure of the Council." The affair, which rests here for the present, appears to call for consideration on ethical grounds in medical as well as in legal circles. King's College, for instance, may have something to say in the matter.

LEADING ARTICLE.

THE GENERAL MEDICAL COUNCIL.

THE eighty-third session of the General Council of Medical Education and Registration was last week introduced by the presidential address of Dr. Donald MacAlister. Needless to say, his speech was lucid, able and comprehensive, and save, perhaps, from the progressive point of view, left little to be desired. A brief analysis of its chief points, however, emphasises the narrowness of the sphere of action covered by the Council and the comparatively small results attained by a machinery of such vast potential power as that undoubtedly possessed by our governing body. If we venture to offer any criticisms, we do so in all friendliness and in the sincere hope that one day the General Medical Council may enter into the fulness of its kingdom. At present the Oxford Street Parliament appears to be going through a phase of imperialism somewhat resembling that which recently swayed the national mind, with results that are still draining the pockets of the taxpayer. The first half of Dr. MacAlister's address was devoted to international reciprocity as regards medical registration. He announced that Nova Scotia had applied to be admitted to share such reciprocal privileges, and that Japan had been actually thus admitted. At the same time he described his reception on a recent occasion at Rome, and dwelt upon the fact that Italy alone of European nations had entered into an agreement of reciprocity with us in respect of medical education. All this is doubtless to the good as an imperial asset, but there are other things nearer home that stand in urgent need of legislative reform. There is, for instance, the enormous mass of quack practice conducted at the expense of the public even more than that of the medical profession. To organise a strict supervision of the education, the qualification, and the ethical life of the legitimate medical practitioner while charlatans are allowed to defraud and swindle the public by the sale of nostrums, and to injure qualified practitioners by the illegitimate practice of surgery and medicine, is to achieve a great feat of topsy-turvy legislation. It is true that the General Medical Council are considering

a petition for incorporation addressed to the Privy Council by the British Optical Association and a Bill now before the Lords entitled "The Sight-Testing Opticians Bill." Both documents, as the President pointed out, propose that powers and privileges shall be conferred on certain persons, who are not qualified medical practitioners, in relation to the diagnosis and treatment of ocular defects. Dr. MacAlister anticipated careful scrutiny of this matter at the hands of the Council on the grounds that the proposals in question touch closely the practice of ophthalmic medicine and surgery. In point of fact, they trench on the legitimate work of one of the best-organised and most powerful of special branches of medical work. The ophthalmic surgeons have taken up the matter vigorously, and have thereby shown a worthy example to the rest of their medical brethren. If the General Medical Council were to adhere to the excellent maxim that they should carefully consider all matters "closely touching" medical and surgical practice, they would at once find their hands full and their proceedings the centre of interest not only of medical men, but of the enormous interests involved in the thousand-and-one fraudulent medical ventures that invade every town, village and remote dwelling of the United Kingdom. Sooner or later drastic registration must follow the rising standard of popular enlightenment. Should the General Medical Council wish to assume any position of real weight in the medical world it will lose no opportunity in advancing such legislation, and especially in increasing its own scope of action and in broadening its own constitution upon democratic and representative lines. There are many ways in which the Council might carry out vigorous repressive measures even on its present basis. To mention one or two such methods: Why should not the Council urge the Government to prohibit the postage of obviously fraudulent quack advertisements? Why not urge the public prosecution of newspapers for conspiracy with fraudulent quacks by inserting their advertisements. Quackery is rendered possible only by advertisement, and the two chief agencies are the daily journals and the post office. It is somewhat reassuring to learn that the Council are introducing two Bills to prevent medical practice by companies. In the process of time we may hope for better things from the new and more progressive policy adopted by the present distinguished President.

Fee for Self-Vaccination.

At a recent meeting of the Guardians of Haslingden Union, Mr. Tomlinson, the Chairman, reported on the conference held in London which had for its object the reduction of the cost of vaccination to Poor-Law unions. It appeared that the cost of vaccination through the whole country had gone up 500 per cent. in ten years. A member asked if a statement that in the conference it was reported that one medical man had charged for vaccinating himself was true. He could scarcely believe it. The Chairman: The statement was made in the conference and the name was given.

NOTES ON CURRENT TOPICS. I

Feeding of School Children.

Now that the Select Committee of the House of Commons appointed to consider the Education (Provision of Meals) Bill has finished taking evidence, it is interesting to review the general feeling that was found to exist among those witnesses who were in position to form an authoritative opinion. The case for the feeding of half-starved children has always been clear to those who value the national physique and the cause of education, but the difficulties of securing that this should be done with the greatest advantage to the child and to the country and the least damage to parental responsibility and to the purse of the ratepayer have been very great. The evidence given before the Select Committee certainly showed one thing, namely, that to embark by Act of Parliament on a large scheme of feeding such children would be to embark on a dangerous experiment, however much it may be restricted and guarded. The necessity for inquiry was abundantly obvious, but we trust that the Committee will not urge the Government into any rash adventure now that the facts are clearly before them. While doubtless in the big towns a certain number of children are underfed these numbers seem to have been exaggerated, for in Glasgow, for example, only about one per cent. of the children appeared not to have been sufficiently fed at home, and, on the other hand, these children are nearly always found to belong to idle, drunken, and careless parents. There was a considerable feeling that the present voluntary agencies could by wise economy of effort cope with the really necessitous cases, and that action should be directed towards making the parents feel the extent of their neglect. We shall be glad to see what the Committee recommend when their report is issued, for though no child should be allowed to starve or be insufficiently fed, the parent when guilty should become the object of the reformers' effort.

Industrial Mortality.

Now that the voice of labour is so powerful in Parliament, the question of dangerous occupations is likely to be regarded as one of ever-increasing importance. The principle of compensation of workmen for injuries sustained by reason of their occupation is nowhere more apparent and more obviously entitled to redress than in the case of diseases contracted in factories and workshops. During the month of April last the total number of cases of poisoning and of anthrax officially reported to the Home Office was fifty-two, consisting of forty-four cases of lead poisoning, one of mercurial poisoning, and seven of anthrax. Out of this list the small proportion of three deaths was recorded, one being due to lead poisoning and two to anthrax. With regard to plumbism, it appears from the returns that the greater number are attributable to trade processes involving fumes. It may be stated broadly that in dusty

lead trades poisoning may be avoided by suitable precautions. There can be little reasonable doubt that a properly qualified scientific investigation would reveal methods whereby the bulk of lead poisoning cases amongst workpeople might be materially reduced, either by improved workshop environment or by the substitution of other materials in place of lead.

London Port Health Work.

IF the system of retaining special privileges for ancient bodies is capable of justification, it is only on grounds of good work thoroughly kept up to the requirements of modern science. It is something of an anomaly that the City of London should still be the health authority for the Port of London; but those who read the annual report of the medical officer of health will be satisfied that he and his staff carry out their unostentatious but vitally important duties with admirable skill and assiduity. According to the last report just issued over 10,000 vessels entered the port during 1905, and over 3,000 of these had to be visited by medical officers because of sickness on board. Three cases of suspected plague were found and detained at the isolation hospital, but in all of them the bacteriological findings were negative. Last autumn, owing to the presence of cholera in Russia and Germany, detailed inspection of ships from ports in those countries had to be made, and it is satisfactory to know that the precautions adopted were sufficient to prevent the entrance of the disease into Great Britain. A rat-destroying campaign has been going on, and the warfare has resulted in the destruction of 60,000 of these unseemly rodents infesting ships and warehouses. Dr. Williams is evidently thoroughly alive to the responsibilities of his post, and is to be congratulated on the success that has attended his efforts.

Post-mortem Signalling.

ONE of the minor drawbacks to living in a community of civilised beings is the difficulty of being original; any idea that is put forward as new by anybody seems to have been anticipated by someone else. We hesitate, therefore, to characterise as original a suggestion which has just been made by a Miss Lind-af-Hageby, to prevent premature burial, but at all events we may claim it as striking. This lady would have all dead bodies removed to a mortuary where they would be under the supervision of a corps of "death verifiers" till these experts were satisfied that life was extinct. Then the bodies would be placed in their graves, but, lest the death verifiers should have been in error, to each grave should be attached a signalling apparatus whereby the dear departed might, if they felt symptoms of reviving consciousness, communicate with their friends above ground. It is said that an experimental cemetery was constructed on these principles in America, and that out of 1,200 bodies there buried no less than six telegraphed to their sorrowing relatives. We hardly think that English people are yet sufficiently Americanised to

believe in the bogey of premature burial and to arrange codes of telegraphic signals with their dying relatives, but in case there be any such timid persons we should recommend a simpler plan than burying them first and seeing if they signalled afterwards. We confess the six signallers in the American cemetery rather "startled us" till we remembered certain "facts" of an equally sensational nature which were associated with a Miss Lind-af-Hageby, and which evaporated into unsubstantialities when presented to a hard-headed British jury.

Conscientious Objectors.

WE have often wondered which is the more puzzling person to diagnose—the *bond-fide* traveller or the conscientious objector. Certain characteristics of each one knows; the *bond-fide* traveller generally has a red nose, and the conscientious objector usually has a loud voice; but neither of these symptoms is pathognomonic. There is one feature, at any rate, they each share in common, namely, the right to be taken on trust by those with whom they are brought into contact. Nobody may question the veracity of a *bond-fide* traveller, and nobody may presume to doubt the disinterestedness of a conscientious objector. A recent circular issued by the Home Secretary to the magistrates throughout the country, to inform them as to their duties with regard to a conscientious objector, is a marvel of circumlocution. "The question for the magistrates," it runs, "is not whether the applicant's belief is well or ill-founded, but solely whether they are satisfied that he conscientiously believes. . . . The Act does not require that the belief should be reasonably founded. It is not necessary to the proof of conscientious objection that a certificate should be produced, or even that evidence should be given, of any particular state of health of the child. Any ignorance on medical or sanitary or statistical questions is no ground for refusal of a certificate." That Mr. Gladstone interprets the Act according to its wording cannot be gainsaid, but what does it all amount to? The Act is hopelessly illogical, and as the Minister for Education has written in his literary past, "An illogical opinion only requires rope enough to hang itself." The "conscientious objector" clause and the Home Secretary's elaborate instruction might be boiled down into the homely saying, "If a man likes to be an ass, let him be as big an ass as he pleases."

Conference on Infantile Mortality.

WE are glad to hear that the National Conference on Infantile Mortality, which is to be held in London next month, promises to be a success. The moving spirits in its inauguration and promotion are Alderman Broadbent, Mayor of Huddersfield, and Bailie Anderson, Convener of the Public Health Committee of Glasgow, both of whom are well-known for their zeal in the cause. It is good news that Mr. John Burns is to be President of the Conference, for it deals with a subject

that needs not only the support of the Government of the day, but also that of a strenuous member of it. In such a position Mr. Burns is likely to be seen at his best. It seems a pity that only two days are to be devoted to the proceedings, as the question is a vast and complicated one, and it will be impossible for its various aspects to be more than touched upon in the time at disposal. Infant mortality, like the tuberculosis death-rate, is one of the test measures of the health of a town, and of the intelligence of its inhabitants, so that it may be said to be the expression of the degree of civilisation reached by a particular community. No one remedy, however important in itself, can be relied upon to put down the excess of infant deaths, for improper feeding, overcrowding, maternal ignorance, and poverty all take a share with the prevalent atmospheric conditions in causing them. If the Conference, by calling attention to the whole question, gains sympathy and support for the efforts of its promoters in quarters where the extent of the evil is unknown, it will do well. We hardly think it can accomplish much more.

A Chronic Cure.

AN interesting sidelight on quack methods was thrown from the dock at the Clerkenwell Sessions last week when one, Ernest Miller, was charged with stealing a watch and chain. The prisoner was a cripple and had what is described as a "withered" left arm; moreover he pretended to be deaf. Although his occupation was given as that of a tailor, Ernest Miller confessed in evidence that he had enjoyed a less onerous and more lucrative position than that of following the goose. His infirmities were his assets, and he had "worked" for Dr. Bodie, a gentleman whose proceedings have been commented on in THE MEDICAL PRESS AND CIRCULAR from time to time. The Chairman asked the detective in charge of the case who Dr. Bodie was, and received a reply to the effect that the gentleman went on the music-hall stage and pretended to cure crippled people. The prisoner was employed to pose as a patient, and used to be carried on to the stage night after night to receive Dr. Bodie's ministrations, which resulted each night in a "cure." Apparently Miller improved in the mimetic art, for as time went on he seemed to be worse when carried on and better when he hopped off. We are thankful to say that for eighteen months he will not have the opportunity of conniving at similar deceptions, as his time will be fully occupied at hard work—an experience we should judge to be as unusual as it will doubtless prove salutary.

Discipline in Teaching Hospitals.

THE medical student is still an attractive interest to the man-in-the-street as one of the few romantic spirits left in these days of grey competition and drab decorousness. The authorities of the medical schools wisely keep a blind side to pranks that are for the most part but harmless outward signs of boisterous animal spirits. To

keep too tight a rein on students of any class is to court disaster. It is to be hoped that these axioms may be carefully considered by the managers of the Edinburgh Royal Infirmary. Some half-dozen students recently met within the walls of that institution to celebrate the departure of one of their number to India. They kept up the gathering beyond the official hour, and appear to have committed some other trivial offences against a complicated and multitudinous set of rules. As a result, their hospital tickets were suspended and they were forbidden to enter the hospital for six months, while their names and sentences were "posted" at the gates. If the facts be as stated—and they have not been officially contradicted—the disparity of the punishment to the offence appears to be of a Gilbertian order. The managers would be wiser in future to consult their medical staff before issuing orders of this Spartan nature.

Mr. Bernard Shaw in Cap and Bells.

MR. BERNARD SHAW has so long posed as jester to the community, and he takes such keen delight in fooling his readers and listeners, that it is just possible he occasionally does not see through his own fooling. We have all heard of the unfortunate gentleman who played the part of the cat in the pantomime with such zest and thoroughness that he came to believe himself a cat, and insisted afterwards on going about on all fours. We confess on reading Mr. Shaw's address to the British Union for the Abolition of Vivisection we are in some doubt as to whether he appeared on all fours or in his proper person. This befogging and puzzling of the public is, of course, part of Mr. Shaw's humour, but it has certain drawbacks. There is just a chance that there are people so matter of fact as to regard his utterances as serious, though we confess his extravagances are so "shavian" (we believe that is the correct word) as to give them warning. Thus it is possible that there are people who will believe that the opposition of medical men to fads such as "anti-vivisection" is, as Mr. Shaw states, only assumed in order to give an excuse for writing signed letters to *The Times*, and thereby attracting fees to the pocket. Advertisement, however, it should be remembered, is just as essential to a writer of plays as to a medical man. It would be too absurd to take Mr. Shaw's vagaries seriously, but really he should be a little more careful to safeguard himself against such a misunderstanding.

A Standard of Puerperal Morbidity.

THERE is no doubt that the progress of medical science is much hindered by the lack of proper statistics on which to base inquiry. Medical men are not, and cannot be, trained statisticians, and under present circumstances every man does what is right in his own eyes. There are no uniform standards, and, consequently, there is the greatest difficulty in collating the experience of different observers. It is this fact which renders the

numerical results of large institutions such as Johns Hopkins University so valuable, merely in lieu of results gathered over a larger area. In the matter of puerperal morbidity, it is some satisfaction that a representative Committee, appointed by the British Medical Association at the suggestion of the Master of the Rotunda Hospital, has recommended a standard which we hope will be accepted as authoritative both by the maternity hospitals and by the practising obstetricians throughout the Kingdom. The standard—a temperature of 100° F. occurring more than once at any time during the first eight days, and all cases of puerperal mortality—is not as exact as all might wish, but it presents the estimable feature of great simplicity. Moreover, the decision of what the standard should be is by no means as important as the fact that a standard has been recommended with authority. We trust that even those who see its imperfections will loyally adopt it.

PERSONAL.

WE understand that Professor Bergmann has been summoned from Berlin to Constantinople to the Sultan's daughter, who is suffering from appendicitis.

A PENSION of over £900 per annum, being two-thirds of the salary and emoluments, amounting to £1,350 a year, has been granted by the Hampshire County Council, to Dr. Thomas Blair Worthington, who, after over 21 years' service, has retired from the post of medical superintendent of the County Asylum at Knowle.

At the Mansion House, London, Lord Rothschild presided at a meeting of the British Red Cross Society, which is an amalgamation of the British National Society for Aid to the Sick and Wounded in War and the Central British Red Cross Council.

A DINNER was given last week by a number of local practitioners to Dr. Irby Webster, ex-medical officer of the Willesden Infirmary, on his leaving Harlesden.

SURGEON-GENERAL SIR THOMAS JOSEPH GALLWEY, K.C.M.G., who has done much useful work in several arduous campaigns, has been chosen to succeed Surgeon-General W. H. M'Namara, C.B., as principal medical officer at Aldershot.

ON the 23rd instant Mr. Whitelaw Reid, the American Ambassador, presided at a festival dinner in aid of the Charing Cross Hospital. Subscriptions were announced amounting to £12,257.

THE annual dinner of the officers of the Indian Medical Service will take place at the New Gaiety Restaurant, London, on Thursday, June 14th, at 7.45 p.m. Particulars can be obtained from Dr. P. J. Freyer, 27, Harley Street, London, W.

SIR DONALD CURRIE, G.C.M.G., through whose munificent gift of upwards of £100,000 the buildings are being erected, will lay the Foundation Stone of the School of Advanced Medical Studies, Nurses' Home, and Maternity Students' House in connection with University College Hospital, London, on Monday, June 11th, at 4 p.m.

MR. PERCY W. G. SARGENT, F.R.C.S., has been appointed Assistant Surgeon to the National Hospital for the Paralysed and Epileptic, London. Mr. Sargent is the eldest son of Mr. E. G. Sargent, of Clifton, and is an Old Cliftonian.

A CLINICAL LECTURE

ON

PERSISTENT DUCTUS ARTERIOSUS.*

By G. A. GIBSON, M.D., Sc.D., LL.D.,

Physician to the Royal Infirmary, Edinburgh; Examiner in Medicine, Oxford University Examiner in Clinical Medicine, Edinburgh University.

AN interesting chapter might be written upon the difficulty often expressed in obtaining a hearing for new facts. It is, indeed, a curious circumstance that obstinate preconceptions frequently prevent the reception of obvious truths. Common rumour tells us that no one above the age of forty accepted the teaching of Harvey; we may well believe it. Perhaps the reluctance exhibited by the learned men of the 17th century to adopt his views should reconcile us to the difficulty we have in securing the reception even of facts which can be stated as definitely, and proved as certainly, as a mathematical problem. These remarks naturally arise as the result of considering the very interesting case now before us. As the various clinical features unfold themselves, you will find that the patient furnishes an excellent illustration of a cardiac affection to which much attention has been given by myself, but of which the diagnosis is not yet generally recognised. On two occasions the subject has been fully explained by me, yet my position is still like that of "the pelican in the wilderness," "the owl in the desert," or "the sparrow alone upon the housetop," to which the Hebrew singer pathetically likened himself. Before dwelling at greater length upon this somewhat depressing aspect of the subject, let me state the facts of the case.

The patient is a strong and muscular man, aged twenty-four, who has been trained as a mason. He has always lived in the country, and enjoyed, as far as he knows, perfect health. As a trooper in the Yeomanry he was always in the van when it came to skirmishing on foot, or any other part of military duty demanding strenuous physical exertion. The patient, if indeed, he may be called so, was sent to me by Dr. Harvey Littlejohn. The reason for his appearing in the Infirmary is that he applied for admission to the Edinburgh Police Force, and on routine examination he was discovered to have some cardiac lesion.

His father died recently of influenza followed by chest complications. His mother and his brothers and sisters are perfectly healthy. He himself cannot remember ever being ill, except when he passed through an attack of measles in youth. He has never suffered from breathlessness or palpitation. There has never been a trace of cyanosis or of chilliness. In short, there have been no symptoms connected with the circulation. On inspection there is no trace of any abnormality either in form or colour; there is no preternatural pulsation in the vessels of the neck; but on producing redness of the forehead there is a slight capillary pulsation. The apex beat is seen in the fifth intercostal space just inside the mammary line; the arteries are perfectly healthy; the pulse is of moderate pressure, and the rate varies from 70 to 80. The character of the pulsation shows a slight

increase in celerity, but it can scarcely be called a good example of Corrigan's pulse. On applying the hand over the præcordia the apex beat is found to have its maximum intensity in the fifth intercostal space half-an-inch inside of the mammilla, and shows no departure from normal strength and rhythm. Palpation, however, reveals one interesting abnormality. In the third left intercostal space, close to the sternum, there is a beautiful thrill, and the rhythm of this thrill is most characteristic. It begins distinctly after the apex beat, as is appreciated on placing a finger over it for comparison, while another finger rests over the third left intercostal space, and it continues for a considerable time after the cessation of the apex beat. On closer analysis it is found that the thrill is continued almost until the following apex beat, and there can be felt most distinctly the recoil of blood upon the semilunar cusps producing the second sound just about the middle of the thrill. This thrill in itself is, as we shall see, absolutely diagnostic. The upper border of cardiac dulness is at the middle of the third left costal cartilage, and transversely it extends 1½ inches to the right, and ¾ inches to the left of midsternum. From the examination, therefore, so far, we may conclude that there is little, if any, hypertrophy. The phenomena observed on auscultation are, at the first blush, slightly confusing, as there is apparently one long continuous murmur occupying both systole and diastole, with a reinforcement of intensity during each of these phases. On more careful analysis, however, the rhythm and distribution of three distinct murmurs become quite clear. At the inner end of the first right intercostal space there is a short, systolic murmur, which is conducted upwards into the vessels of the neck. In the midsternum, opposite the attachment of the fourth costal cartilages, there is a soft, short diastolic murmur which is propagated for a short distance towards the ensiform cartilage. Taken in connection with the other phenomena, which have been described, there can be no doubt that these two murmurs are produced by aortic obstruction and regurgitation. In the third left intercostal space, an inch and a half from the edge of the sternum, there is another murmur perfectly distinct in character from the two just mentioned. It begins quite obviously after the commencement of the first sound. It is continued during the latter part of that sound and the whole of the short pause. It persists throughout the second sound, and dies away gradually during the long pause. The murmur is distinctly rough and thrilling in its character. It begins, however, somewhat softly, and increases in intensity so as to reach its acme just about, or immediately after, the incidence of the second sound, and from that point gradually wanes till its termination. The second sound can be heard to be loud and clanging, and when carefully analysed it is the

* A Clinical Lecture delivered in the Royal Infirmary, Edinburgh.

pulmonary part of that sound which is accentuated. The blood shows a slight increase in its normal constituents. The erythrocytes reach 5,300,000, and the leucocytes 10,000 per c.mm.; the hæmoglobin amount to 90 per cent. There is, therefore, a slight tendency towards the condition of blood found in cyanosis. There is no trace of any departure from normal conditions in any other system of the body.

In this case we have phenomena which are not merely characteristic, but are absolutely pathognomonic. Although the arterial pulse is not a very good example of that which is so often found in aortic incompetence, yet it has a certain amount of resemblance to the features described by Corrigan and in association with the capillary pulse it is suggestive, the position and conduction of the systolic and diastolic murmurs are characteristic, and there can be no room for doubt as to the existence of a moderate degree of aortic obstruction and incompetence. We may dismiss this part of the case without further comment except to remark that the aortic lesions have produced but little interference with the circulation, seeing that there is practically no alteration in the size of the heart.

The most interesting features of the case, and those which have led me to bring the patient before you to-day, centre in the thrill which is felt in the second intercostal space, and also in the murmur which accompanies it, the maximum intensity of which you will remember is in the third left intercostal space. It is unnecessary to tell you that the rhythm of the thrill and murmur at once negative the possibility of their being produced in the heart itself. There is absolutely no possibility of the production of a murmur in the heart surviving two phases of cardiac activity. In this case the thrill and murmur begin about the middle of the first sound, when the great venous valves are closed and the arterial valves are open. They continue during the short pause, and accompany the second sound, when the auriculo-ventricular valves are opening and the arterial valves are closing, and they die away about the middle of the long pause. No cardiac valvular lesion could produce such phenomena. No lesion of the inter-auricular or inter-ventricular septa could produce such effects. The only possible cause for it must be a lesion connected with one of the great arteries in which there is high pressure existing from shortly after the ventricular contraction until shortly before the next ventricular systole. With the situation of the thrill and murmur as they are in this case, it must be obvious that the aorta or the pulmonary artery must be the origin of the appearances. As there is no indication of any disturbance connected with the chest, apart from the facts which have been brought before you, it is perfectly obvious from the anatomical position of the thrill and murmur that they must be caused by a stream passing from the aorta to the pulmonary artery. It is possible to conceive of a communication between the two vessels produced by a small aortic aneurysm opening into the pulmonary artery and producing physical signs somewhat resembling those which have been placed before you. Roberts, (1) Wade, (2) and Walshe (3) have described such cases, and several similar instances have recently been described by Gairdner (4), who has summarised the observations of the

authors just mentioned. Two points negative an explanation of this kind: Firstly, there is very little alteration in the condition of the arterial walls; secondly, the thrill and murmur do not begin at the commencement of the first sound, as does an ordinary systolic murmur in aneurysm of the first part of the aorta, but they follow the commencement of the first sound by an appreciable interval. It is, therefore, absolutely beyond the possibility of doubt that we have in this case a persistent ductus arteriosus. Several cases presenting perfectly identical symptoms and signs have been under my care during the last few years. In describing systematically the pathological features and clinical results of persistent patency of the arterial duct, two of these cases were detailed by me, and the rhythm of the thrill and murmur was diagrammatically figured in order to illustrate the semblance of rational symptoms and physical signs produced by the affection. (5) Two years afterwards a most beautiful example of the affection, absolutely free from all complication by the presence of any other lesion, was under my care in the Royal Infirmary. The features of the case were demonstrated in the wards and in the theatre, and the diagnosis of a perfectly uncomplicated ductus arteriosus was made. The patient was in my ward on account of anæmia, and, after making an excellent recovery, she went out. A few weeks later she was readmitted on account of lobar pneumonia, of which she died, and at the *post mortem* examination we found that there was absolutely no trace of any cardiac lesion, but that the ductus arteriosus was patent. These facts formed the subject of a Clinical Lecture, afterwards published, (6) and furnished an absolute proof of the possibility of diagnosing the lesion under consideration. And yet, in spite of this absolute demonstration of the correctness of my contention as proved by the pathological results, the diagnosis of this lesion appears to be still a subject of scepticism. In the latest edition of one of the best works on "Physical Diagnosis," that of my friend Dr. R. C. Cabot, the following sentence occurs:—"It is been claimed that a murmur occurring through systole and into diastole is diagnostic of an open arterial duct, but this supposition is not borne out by *post-mortem* evidence." (7) The clinical lecture to which reference has been made must have escaped his observation.

To sum up the essential facts upon which the diagnosis of persistent arterial duct may be confidently founded, let me mention that there may be no dyspnoea, cyanosis, œdema, or other evidence of disturbance of the general circulation, the recognition of the lesion depending entirely on the presence of two physical signs. Inspection may fail to reveal any facts of importance; palpation yields the valuable sign of a long thrill following the apical impulse, and continuing beyond the recoil of the blood on the semi-lunar cusps, the shock of which may be felt during the thrill; percussion may negative the suspicion of any increase of cardiac dulness—in fact, it usually does so in uncomplicated cases; auscultation gives the second and the most invariable evidence of the lesion in the presence of a murmur which is pathognomonic. Beginning distinctly after the first sound, it accompanies the latter part of that sound, occupies the first pause, accompanies the second sound, which may be accentuated in the

pulmonary area or may be doubled, and finally dies away during the long pause.

NOTE.—A Clinical Lecture by a well-known teacher appears in each number of the journal. The Lecture in next week's number will be by Arthur P. Beddard, M.D. Cantab., F.R.C.P. Lond., Assistant Physician to Guy's Hospital, Physician to the West London Hospital, &c., "On Cough" (delivered at Guy's Hospital).

ORIGINAL PAPERS.

A NOTE ON
ACUTE HERPETIFORM STOMATITIS
AND OTHER FORMS OF
ULCERATIVE STOMATITIS IN
ADULTS.

By F. PARKES WEBER, M.D.,

AND

KARL FURTH, M.D.,

Physicians to the German Hospital, London.

THE clinical group of cases which may be placed under the heading acute herpetic stomatitis, though doubtless recognised in practice by many, is not much considered in the ordinary text-books. Hall and Tilley (1) say: "Occasionally an eruption of vesicles resembling those seen on the skin in cases of herpes is observed on the pharynx. Accompanying the eruption there are shiverings and feverish symptoms. The patients complain of sore throat, and on inspection small vesicles are seen on the palate and fauces; these speedily burst and form round ulcers." J. E. Garretson (2) speaks of "herpetic tonsillitis" and "herpes of the pharynx." F. Kraus (3), in Nothnagel's "System," enters into the subject at rather greater length, and, under the heading "Pseudo-Herpes Buccalis" or "Stomatopharyngitis herpeticiformis," writes: "Acute catarrhal sore throat is rarely (though occasionally in several cases simultaneously) associated with 'herpes of the pharynx' ('angina herpeticus')." Such cases are characterised by the development of crops of vesicles on the tonsils and their neighbourhood. The vesicles last only a short time, being succeeded by pseudo-membranes of small or medium size. The herpetic eruption may likewise appear on the lips and the buccal mucous membrane. Of this affection there is an acute form, a (rare) protracted form, and a recurrent form." Kraus goes on to say that in the acute form the active stage lasts four or five days, and is accompanied by fever, up to about 103° F. The rare protracted form is characterised by repeated relapses accompanied by the appearance of fresh crops of vesicles. In the recurrent form the patient is repeatedly affected at longer or shorter intervals. Thus, he says, some women suffer from a slight herpetic sore throat (angina herpeticus) with nearly every menstrual period.

The following case observed by one of us is a typical example of the acute form:—

E.O., a young German, æt. 17, was spending the Easter holidays in the Isle of Wight, when on April 17th he complained of pain in swallowing and some general malaise. He came up to London and was first examined on the morning of the 19th. He then had a temperature of 103.2° F., and the pulse was 108;

the tongue was very much coated, the gums were red and swollen, the mucous membrane of the pharynx was very red, the left tonsil was considerably swollen and the submaxillary lymphatic glands on the left side were enlarged and very tender on pressure. The patient complained of considerable pain in his throat and mouth, and was quite unable to bite solid food. He was given aspirin, and was treated locally by gargles of chlorate of potassium, peroxide of hydrogen, and borax and glycerine; a wet compress was applied to the neck. On the following day a number of small ulcers could be seen on the underlip, the tonsil, and the soft palate. The ulcers were about the size of a linseed, or a little larger, and had a yellowish white surface with a deep red margin. Small vesicles could be detected at two or three parts of the soft palate. These, however, did not remain long, but in the course of a day presented the same appearance as the above described ulcers. During the next two days some fresh ulcers developed, especially on both edges and the under surface of the tongue, which were extremely painful. The swelling of the gums increased, the mucous membrane presented a whitish grey appearance, and at many places, especially on the projections between the teeth, there were small ulcers, but not surrounded by a red border like those on the lips and palate. There were also some distinct ulcers on the left tonsil. The right tonsil was not affected. The tongue itself was not much swollen. There was constant salivation, at least two pints of saliva being secreted in the 24 hours. On April 21st both lips were much swollen, and the underlip was covered with vesicles which soon broke and began to suppurate. No lymphatic glands except the submaxillary on the left side were enlarged. The temperature kept to about 101° to 102° F., but it should be mentioned that the patient was being treated with aspirin. The whole condition was so painful that he was only just able to swallow milk by the help of a glass tube. After April 23rd there was no fresh eruption, and the condition soon improved. The temperature was normal on April 25th, and after the affected parts were touched several times with a solution of nitrate of silver rapid improvement took place.

The following is another case observed by us:—W.T., a healthy man, æt. 36, began to suffer about December 2nd from sore mouth, enlargement of lymphatic glands under the jaw, and fever (102° to 103° F.). He could not eat, and there was constipation. When he was seen on December 7th there were minute sore spots on the tongue and lips, fœtor *ex ore*, and tender enlarged lymphatic glands under the jaw. The temperature then was 102.2° F. On the evening of December 8th the temperature was only 99.2° F. (the patient had been given some antipyrin), but the sore spots in the mouth were still present. Chlorate of potassium was used in this case. The patient rapidly improved. In this affection the gums seem to recover later than the rest of the mouth.

There appears to be no definite connection with influenza, but some years ago a house-physician at the German Hospital suffered from probably the same form of stomatitis when there was influenza about. As far as we know, no proper bacteriological investigations have yet been carried out. In June, 1898, two brothers came to the Out-patient department at the German Hospital both suffering from herpetic stomatitis. The younger one, æt. 19, had only been affected five days and had enlarged lymphatic glands under the jaw, whilst no glands could be felt in the elder one, æt. 20, in whom the stomatitis had commenced eleven days ago. These two brothers worked as clerks in a building where drainage alterations had recently been carried out. Small epidemics of "ulcerative stomatitis," probably of the same nature, have been described. (4)

Typical cases of acute herpetic stomatitis do not last much longer than a week, and protracted cases, such as those of the second class mentioned by Kraus, must be very rare.

Goodhart (5), speaking of ulcerative stomatitis in the adult, which, he remarks, some would call "herpes of the mouth," says the attacks are recurrent at intervals in certain individuals. Apparently these recurrent cases referred to by Goodhart are similar to those of the third group to which Kraus refers when he says that some women suffer from a slight "angina herpetica" with every menstrual period.

In regard to diagnosis, acute herpetic stomatitis is not likely to be confused with true herpes zoster (unilateral), when the latter (as it only very rarely does) affects the tongue or other parts of the interior of the mouth. True "foot and mouth disease" is probably so rare, if it occurs in man at all in England, that it hardly comes into the question. Squamous pemphigus may occasionally, however, affect the mouth, pharynx, or larynx, whilst the skin is free, or practically free, from eruption. This is usually a very severe affection and its chronicity alone distinguishes it from the cases which we group under the heading "acute herpetic stomatitis."

It is possible, however, as has been suggested, we believe, by Dr. Pringle, that some of the protracted and "recurrent" cases of herpetic stomatitis, and some of the cases classed as "dyspeptic" or "neurotic" ulcers of the mouth may in reality be minor forms of chronic and recurrent pemphigus of the mouth.

In 1903 one of us in an Out-patient department saw a delicate-looking woman, æt. about 43, with probably tuberculous signs at the apex of one lung. She said she was subject to ulcers of the mouth and tongue which were painful when any salt from her food irritated them. She had a small ulcer, smaller than the size of a silver threepence on the inner surface of one lip, which had lasted about 14 days; such ulcers, she said, seldom lasted more than two weeks; sometimes she had two or three in the mouth at the same time. She seemed to think that the ulcers in the mouth bore no definite relation to digestive disturbances, constipation, or the menstrual periods. In May, 1903, one of us had a woman, æt. 29, under his care as a hospital in-patient, who had spat a little blood, probably from the mouth. The history was that in October, 1902, little ulcers began to appear on the buccal mucous membrane and under the tongue. In the hospital, in 1903, the ulcers had a whitish appearance, and some of them were found to commence as blebs and then break. There were generally three or four present in the mouth at the same time, and probably no single one lasted many days; fresh ulcers appeared as the old ones disappeared. Their onset was accompanied by pain and there was occasionally slight evening fever (to about 100° F.). The condition seemed not to be much affected by treatment. There was no suspicion of artificial production.

A. Jacobi (6), of New York, and W. K. Sibley (7) have written interesting articles on "Neurotic Ulcers of the Mouth" ("stomatitis neurotica chronica") and Jacobi in his account collected all the cases he could find recorded. Two of his patients were men (8). Sibley's three patients were all women. Sibley speaks of the persistence of the affection through many years, and considers that the ulcers are the result of a distinct trophoneurosis, mental trouble appearing to be the underlying cause. In his cases no medicinal treatment appeared to give very obvious result, and he regarded removal from home and its accompanying worries as the only curative treatment.

TRAUMATIC INFLAMMATIONS OF THE KNEE-JOINT.

BY ALBERT HOFFA, M.D.,

Geh. Medizinalrat, Professor Extraordinary of Orthopædic Surgery and Director of the Poliklinik für Orthopædies, University of Berlin.

SPECIALLY REPORTED BY OUR BERLIN CORRESPONDENT.

LAST year I drew attention to a very frequent disease of the knee-joint which has a high practical interest. I named the disease from an anatomical standpoint, Fibro hyperplasia of the fatty bodies lying in the plicæ alares below the patella. From the anatomical examination made by my assistant, Dr. Becher, on the material then at hand, I have further described the process that takes place in the sub-patellar fatty bodies and which consists first in cellular infiltration of the sub-intimal tissues, in the formation of young connective tissue cells in perivascular cell collection around the deeply running vessels; and with this villous increase, hyperæmia of the vessels and hæmorrhage into the tissues.

The affection progresses, there is especially increased vascularity, and it becomes visible as the residuum of hæmorrhage that has taken place into the connective tissue enveloping the foreign bodies. I have attributed the process to traumatic causes.

As regards the clinical symptoms of the affection now described, they consist in typical phenomena of incarceration, in attacks of pain and in disturbance of the function of the joint.

As objective symptoms there is, along with a more or less considerable atrophy of the quadriceps muscle, a characteristic swelling on both sides of the ligamentum patellæ, in the tissue lying between this and the patella. This swelling is of firm consistence, shows pseudo-fluctuation, and readily "creaks" on palpation.

Finally I pointed to the good results that had been obtained in such troubles by extirpation of this sub-patellar fatty body.

My work quickly met with confirmation from Lejars, of Paris, and from Gangele, who removed similar fatty bodies from the foot in case of flat foot. Flint also met with similar bodies.

In the course of time our experiences on this question have increased; I have now a considerable series of cases (43) in which I have extirpated the fatty bodies at times along with partial arthrectomies. Regarding the anatomical examination of the material removed, for which I am indebted to my first assistant, Dr. Wollenberg, we shall report more in detail later on, along with our other pathological joint material. Here I will only give a general account of traumatic arthritis, with which are associated the typical feature of connective tissue hyperplasia of the sub-patellar fatty bodies over the course of the disease, its pathological anatomy, its diagnosis and treatment.

Traumatic arthritis arises through subcutaneous injury to the joint; in the slighter cases it does not arise from a single grosser knock, but from a series of smaller ones, of which the patient can have been scarcely conscious. The disease described by me, that has its seat in the sub-patellar fatty bodies, is frequently due to the milder chronic traumata of that

kind, and yet the action of these lesser individual traumatisms mounts up, inasmuch as more swelling or hæmorrhage is left every time, so that every fresh injury makes it worse, through causing increase of tissue.

That form known as distortion, sprain, is to be considered a severer form of traumatic joint disease; here there is a more severe dragging or incarceration of the soft parts of the joint, but without grosser lacerations.

The severest form of trauma is that which leads to laceration of the capsule and ligaments, and, further, to injury to the bony constituents themselves.

All these injuries have this in common, that the affected joint first of all reacts with exudative symptoms; these in slight cases may be insignificant or even not noticeable. In the cases designated as distortions, in which there is not much hæmorrhage, there is in a few days a good deal of severe effusion, and through this, swelling and functional disturbance of the joint. The pains present at the moment of the injury generally disappear quickly, but usually return with the increased swelling.

The severest form of traumatic articular disease, causes rapid and highly marked symptoms, the effusion of blood reaches its maximum in a few hours and the pain is great.

Whilst in the latter cases surgical aid is procured at once, in the slighter ones the patients take care of themselves and even then only a short time. They frequently, however, attempt self-ordered "functional treatment," but in vain, for they add fresh irritations to the diseased joints. Then when the joint gets worse rather than better, all possible methods of treatment are naturally attempted, and then we frequently meet these cases in our consulting room, months or even years after the receipt of the injury.

We will at present devote especial attention to this group, as it forms a large contingent of our joint disease cases, and as even in its advanced stages is accessible to treatment.

We will first describe the anatomical processes in the diseased joints. The effusion that usually disappears rapidly under suitable treatment shows a disposition to return when the joint is used too much. With the least injury a fresh effusion takes place, with all its troublesome symptoms. If such a joint is cut into we find in it a greater or lesser quantity of fluid, poor in mucin, serous in character and yellowish in colour. The synovia is reddened and swollen, especially whenever there are naturally folds in it, therefore especially in the lateral folds, in the folds around the patella and those of the upper recess, particularly also in the villi of the subpatellar and subpatellar fatty tissue.

If we examine the synovial membrane microscopically we find in the recent cases a vascular new growth, especially in the narrow connective tissue zone directly below the intima of the membrane as well as in the newly-formed villi. We find that the normal villi show processes of growth, also where the synovia lies flat, or only slightly wavy we find villous formation. These villous growths are naturally most luxuriant, where the villi are normally most frequent—that is, in the above-mentioned folds of the synovial membrane. The intima is in parts covered by a thin layer of organised fibrine, rich in connective tissue elements, which in later stages takes on a pale violet tinge with Weigert's staining.

We find further in recent cases young connective tissue cells with large white nuclei which, starting in the adventitia of the vessels and following the course of the vessels, complete the substitution of the fat tissue by connective tissue.

The subintimal connective tissue, as well as the synovia itself, is diffusely studded with more or less numerous, mostly mononuclear leucocytes, with small nuclei that stain deeply with nuclear colouring material. Along with these diffuse infiltrations, we find here and there perivascular lymphoma-like

accumulations of these leucocytes, but not nearly so numerous and bulky as we see them in certain forms of "infectious articular inflammations." We have never found fresh hæmorrhages in the last of the preparations examined, but frequently pigment which lay partly intracellularly and partly extracellularly in the inter-spaces of the connective tissue. But we have never seen such copious pigment in these forms of disease as in cases of gonorrhœal arthritis, arthritis deformans, and "rheumatism." If the process advances we find an even more abundant connective tissue mass that has taken the place of the sub-synovial fat. The older this connective tissue becomes the poorer it becomes in nuclei. Its basic substance becomes closer, more homogeneous, more shiny, and shows frequent degenerations (especially mucous and hyaline degenerations). The fatty tissue also has at last participated in the process of proliferation, inasmuch, as in certain groups of cells it has grown into the newly-formed connective tissue; thus it can fill up quite newly-formed (originally) connective tissue villi, whereby they become broader and flatter.

The changes here described are met with, as our latest investigations showed, in the cases that present the appearances of simple fibrous hyperplasia of the sub-patellar fatty tissue, generally not only in these fatty bodies but the whole synovia shows similar changes with only slight differences corresponding to the anatomical differences in the structure of the synovia in the different parts of the cavity of the joint. Our investigations show us, as I remarked in my first publication on the subject, that "the injury may proceed from the interior of the joint, in so far as the fatty tissue (or the synovia) can be drawn into sympathy by a condition of chronic irritation." We find, therefore, exactly similar changes of the synovia in arthritis deformans with free bodies, in internal derangement, &c. In the latter cases, we must look upon the changes of the synovia as secondary and traumatic.

After the anatomical details I now proceed shortly to diagnosis:—

The history of the clinical conditions described places us in a position to fix the diagnosis with tolerable certainty. That mistakes may occur is proved to us by three very interesting cases in which we found tuberculosis of the synovial membrane, one of which was scarcely capable of diagnosis, inasmuch as the anatomical examination brought into evidence that recent miliary tuberculosis had developed on an old chronic arthritis which had led to excessive hyperplasia of the connective tissue. The tubercle nodules were nowhere confluent, and had nowhere become caseous.

Quite recently we have acquired a beautiful means of making our diagnosis more certain in Robinson and Werndorff's Röntgenography, after preliminary insufflation of oxygen into the joint. This process allows a differentiation of the soft parts of the joint never before known. We carry out the insufflation by means of an apparatus devised by Dr. Wollenberg. It is simple and does its work well.

Finally, as regards treatment, I need not go into that of the recent traumatic affections, as with neglected cases of which we are speaking principally their surgical treatment with certain limitations is more rapid and most certain. The procedure made use of by us is a partial arthrectomy. I proceed from the thought that the chief pain and troubles are caused by the rubbing the folds of the synovial membrane with their villi against each other at every movement, and by incarceration of the fatty tissue masses caused by their growth. Our aim is, therefore, mainly to remove these projecting folds and villi. We usually make a longitudinal incision on the inner side of the patella for the reason that the greatest changes in the joint are usually on the median side. We only add an external incision when there are growths outside the patella that cannot be reached from the internal incision. We now extirpate the hypertrophic fatty bodies as well as the villi and folds, paying special

attention to the re-duplication folds of the upper recess, and the folds around the patella, and also to the synovial covering of the condyles of the femur.

The main suture includes the fascia; sometimes when the hæmorrhage is free we place a strip of gauze in the lower angle of the wound, otherwise we close the wound at once. The leg remains from two to four days on a splint. After eight to ten days the sutures are removed and we commence with the after treatment, which consists of massage and passive movement. After twelve to fourteen days the patient gets up. The whole course of treatment generally lasts from six to eight weeks.

When I first spoke of a limitation of the indications, I had in mind chiefly the physical condition of the patient. Strong, energetic people, who wish to get well, may be promised a speedy recovery, but it is different with weakly individuals without energy, and with those whose minds are under the influence of adverse circumstances.

In such cases we first try a lengthened course, with the usual mechanical curative means. This is principally in the direction of strengthening the power of the quadriceps muscle. It is only when these measures fail that operation comes into question.

Operation removes the troubles with almost absolute certainty, and may be unconditionally described as the simplest and safest method. Out of my forty-three cases operated on, in only one, and that a highly nervous woman, did any loss of power of movement remain, and in a second in which complete ankylosis of the joint had taken place. The result in the latter case is due to faulty operation. To be safe, I allowed myself to be led astray into dusting the joint with iodoform powder after a perfectly aseptic operation, easily performed. Excessive swelling with great pain came on at once, which prevented mobilisation of the joint. Later on, outward *brisement* was done, but without result. This is the only case in which any wound complication has arisen, and it was certainly due to the insufflation of the iodoform into the joint. All the other cases went on smoothly, and the patients got rid of their troubles.

OPERATING THEATRES.

NORTH WEST LONDON HOSPITAL.

ANEURYSM OF THE INTERNAL SAPHENOUS VEIN.—MR. MAYO COLLIER operated on a young woman, æt. 20, who had been admitted into hospital suffering from a swelling on the inner side of the right knee joint. The patient was a strong, healthy girl, who up to this time had enjoyed the best of health. Her occupation was that of a housemaid, and her duties as such had not been particularly arduous. There was no history of injury. The present swelling on the inner aspect of the knee joint had existed some time, but until recently had not caused any pain or discomfort. The skin over the swelling was quite normal and was not adherent. On pressure the tumour could be made to disappear, only to return immediately the fingers were withdrawn. A distinct thrill could be heard with the stethoscope, but pressure below the swelling would annul this sound. It was evident that the tumour was connected with the internal saphenous vein and was not a hernial protrusion from the joint. Mr. Collier made a longitudinal incision over the site of the tumour, and a fair thickness of superficial fascia having been divided a large aneurysm-like swelling was found attached to the outer aspect of the internal saphenous vein. The swelling was about the size and shape of a bantam's egg; the vein above and below was not particularly thickened but appeared larger in calibre than would have been expected. The dilatation itself was not thin walled, and it appeared of much the same thickness and consistence as the vessel. It was easily dissected out

from its surroundings, it was not adherent to the skin or to the capsule of the joint. A ligature was passed round the vein above and below and the tumour removed. Mr. Collier said this would have been a most perfect example of an aneurysm had it occurred in an artery, and he was not aware that a similar dilatation of all the coats of a vein had been recorded. He could offer no satisfactory explanation of the condition found. It should, he said, be noted that the dilatation differed entirely from the ordinary bulgings found on varicose veins, in so far as the tumour was attached to one side only of the saphenous vein and did not involve the whole circumference of the vessel.

WESTERN OPHTHALMIC HOSPITAL.

EXCISION OF LACHRYMAL SAC.—MR. G. W. THOMPSON operated on a woman, æt. 45, who had been admitted for long-standing obstruction of the nasal duct with dilatation of the lachrymal sac. After all aseptic precautions had been taken, Mr. Thompson, before beginning, said this operation was best done in adults without a general anæsthetic, by a subcutaneous injection of a mixture of 4 per cent. cocaine with adrenaline chloride, 1 in 4,000, equal parts, one injection generally sufficing. A vertical incision was made over the sac, cutting through the muscular fibres of the orbicularis, the muscles not being atrophied; a Müller's speculum, was then introduced in order to keep open the skin wound. (In the absence of this instrument, Mr. Thompson stated that a skin suture on either side, weighted, would serve the same purpose). Then a slight vertical incision was carried along the junction of the lachrymal and nasal bones through the connective tissue, so as to separate the sac from the lachrymal bone; a kind of dissector was now employed to separate the inner wall of the sac from the lachrymal bone, the separation reaching the commencement of the nasal duct downwards and upwards as far as possible. The next procedure was to separate the outer wall of the sac from the surrounding tissues with the same instrument, the separation being continued until it met the division on the inner side, thus completing the circle. A tenotomy hook was used to further complete the separation downwards and upwards. There was always considerable difficulty experienced, Mr. Thompson said, in dislodging the upper part or head of the sac from its connections with the lachrymal bone and the internal tarsal ligament, but a little careful manipulation with the curette and dissector (which should always occupy a few minutes, lest a portion of the sac be torn through or left behind) was generally sufficient (there was no need to divide the internal tarsal ligament). The next step was to seize the sac with a pair of dissecting forceps, pull it downwards and forwards, and proceed to cut, by means of a pair of straight narrow scissors, its connection with the membranous portion of the nasal duct. The aim in snipping it, Mr. Thompson pointed out, was to get a long way down the bony nasal canal in order to get rid of as much of the diseased tissue as possible. This manœuvre, being over the wound was sewn up and a firm bandage, with elastic pressure to be kept on for a couple of days, was applied; this was to prevent exudation into the space left by the removal of the sac. Mr. Thompson thought in adults local anæsthesia was advisable in preference to general because there was less bleeding, and free access was possible as no mask was over the patient's face; besides, all possible disadvantages of a general anæsthetic were obviated. He said it was a long way preferable not to open the sac, nor was it necessary to introduce a probe into the canaliculus to serve as a director. The operation, he said,

was quickly done, and saved the patient the risk of a serious affection of the eye at any time of his or her life. Again, syringing and repeated probings were thus spared, and that meant a great deal of time saved to the patient, besides the possibility of the latter not succeeding in curing the condition. With regard

to the question of tears, they continued to overflow for three to six months and then they usually stopped permanently, but in about 1 in 15 cases of excision of the sac the overflow of tears down the cheek continued; under such circumstances it would become necessary to excise a portion of the lachrymal gland itself.

TRANSACTIONS OF SOCIETIES.

CLINICAL SOCIETY OF LONDON.

MEETING HELD FRIDAY, MAY 25TH, 1906.

The President, Mr. CLUTTON, in the Chair.

AFTER the general business of the annual meeting had been concluded,

Dr. FRANCIS HAWKINS (Reading) read an account of a case of

THROMBOSIS OF THE ABDOMINAL AORTA, in a female, *æt.* 56. She was first seen in 1900, when she complained of pains in the head, giddiness with a feeling of pitching forward, and reeling when walking. She was not seen again till May, 1904. Four months previously (Jan. 1904) while standing at work she suddenly felt cramp-like pains in her right leg, and subsequently similar pains in her left leg. Later she found her legs gradually become weaker. When seen, she complained of a numb feeling in her legs, which were extremely sensitive to touch; deep pressure produced great pain, especially so in the calf of the leg. Knee jerks were present. The skin of legs was of normal colour. On June 4th, quite suddenly, the legs became very numb, cold, and white. The lips became blue, hands cold, and pulse at wrist very feeble. No femoral pulse could be felt. An hour later there was severe abdominal pain with vomiting and subsequently great abdominal distension, and the patient died. At the autopsy mitral stenosis was found. The femoral and iliac arteries were quite occluded with blood clot, and a blood clot was found in the abdominal aorta, extending up above the superior mesenteric artery. At the bifurcation of the aorta on the posterior wall a calcareous plate was seen. There was an old infarct in the right kidney and several recent ones in both kidneys. Dr. Hawkins commented upon the causation of the condition.

Dr. FAWCETT showed three specimens of thrombosis of the aorta.

Mr. WARRINGTON HAWARD referred to the rarity of thrombosis of the aorta compared with atheroma there, and suggested that there was in this case some blood alteration.

Mr. A. E. BAKER narrated the case of a woman with heart disease who woke up with great pain in the legs. Pulsation was absent in both femorals, but returned on the right side forty-eight hours later, when gangrene began in the left foot. The left leg was amputated and the vessels found normal. From the suddenness of the onset he concluded that embolism had occurred.

Dr. A. E. GARROD remembered a charwoman being admitted into St. Bartholomew's with numbness of the feet. There was no abdominal pain, as in Dr. Hawkins' case. After death, the clot was found to extend only an inch above the bifurcation.

Dr. CHARLES R. BOX communicated a series of cases in which Pulmonary Embolism was due to the Displacement of a Thrombus in the main trunk of the pulmonary artery. In each instance there was reason to believe that pulmonary thrombosis had first occurred, and was later followed by displacement of the clot with the development of the symptoms of pulmonary embolism. The series included cases of cellulitis of the leg, severe burns, typhoid fever, diabetes mellitus, malignant disease of abdomen and operations for the radical cure

of hernia. Stress was laid upon the importance of recognising the premonitory signs of the condition, which were the development of a murmur at the base of the heart, acceleration of the pulse and moderate cyanosis with dyspnoea. It was pointed out that death might be practically instantaneous, with pallor, or delayed, with cyanosis and asphyxia. Infarction of the lung was exceptional. The prophylaxis and treatment of the condition was briefly summarised, and the possible danger of artificial respiration in further dislodging the clot was mentioned.

Mr. W. C. SPENCER did not think that absence of clot in the peripheral proved that the clot had formed in the pulmonary vessels.

Dr. H. H. TOOTH mentioned several cases in which a coiled up clot had been found. In one case it appeared to be a cast of the inferior vena cava.

Dr. A. E. RUSSELL asked for suggestions as regards treatment.

Surg.-Gen. LONGHURST suggested the use of ammonia.

Mr. CLUTTON and Mr. MAKINS both related cases in which the clot had come from veins.

Dr. C. R. BOX, in reply, said that the presence of a mould of the pulmonary valves on the clot seemed to prove that it had formed at that situation.

Dr. F. PARKES WEBER read a short paper on a case of ACUTE DILATATION (ACUTE ATONY) OF THE STOMACH AND INTESTINES CONNECTED WITH PNEUMONIA AND PLEURO-PERICARDITIS.

Patient was a debilitated and delicate-looking young woman, *æt.* 21. She was admitted to the hospital on about the third day of an attack of pleuro pneumonia. Since the illness (diphtheria?) six weeks previously she had developed a tendency to belch up wind. Just before admission she had been able to eat nothing, but after admission she took a good deal of food and at the same time lost the power of bringing up wind; this probably marked the commencement of the gastrointestinal muscular atony and the acute distension followed. Great relief resulted from lavage of the stomach, but the meteorism did not immediately subside, showing that the intestines as well as the stomach were involved. Afterwards for some time there was pericardial friction to be heard, but the progress of the case was ultimately satisfactory. Three out of the forty-four cases of acute dilatation of the stomach collected by Campbell Thomson were connected with pleurisy and pneumonia. The present cases ought perhaps rather to be termed "acute tonic gastro-intestinal tympanites." Dr. Weber alluded to the analogy between "acute dilatation of the stomach," "ballooning of the rectum," "paralysis of the non-gravid uterus," and "acute atony of the urinary bladder during operations," all of these conditions being temporary states of atony in hollow muscular viscera. Exact studies on the innervation have already helped to elucidate some of them.

Dr. FAWCETT considered that "paralytic" was a better term in this connection than "atonic."

Dr. C. R. BOX suggested that acute dilatation might possibly be due to obstruction, say in the duodenum.

Dr. NORMAN DALTON mentioned a case in which influenza was followed first by gastrectasis and later by enterectasis. He thought the condition was toxæmic and not obstructive.

ROYAL ACADEMY OF MEDICINE IN IRELAND

SECTION OF PATHOLOGY.

MEETING HELD FRIDAY, MAY 4TH, 1906.

The President, JOSEPH O'CARROLL, M.D., F.R.C.P.I.,
in the Chair.

EXHIBITS.

Dr. F. C. PURSER exhibited organs from a case of cancer of head of pancreas. He said the patient, a man, *æt.* 57, complained of pain in the abdomen, especially in the region of the umbilicus. He gave a history of syphilis, jaundice, and great emaciation. The clinical notes revealed that the heart was normal as regarded the position of the apex beat. No murmur was heard. Patient developed sensory aphasia and hemiplegia of the right side, due to an embolus lodged in the cortical branches of the middle cerebral artery, and died on April 2nd. A large thrombus was found in the left ventricle, and well-marked vegetations on the aortic valves. Cocci were discernible in sections of the thrombi under the microscope. Thrombi formation in the heart was well known in cases of cancer; and it was not yet settled whether such a condition was due to organisms or to slow circulation. A hæmorrhagic infarct was found in the spleen and secondary growths in the liver.

Dr. O'CARROLL said fat necrosis was a common occurrence in pancreatic disease.

Prof. MCWEENEY inquired were there any thrombi on the right side of the heart.

Dr. PURSER, in reply, said that no thrombi were found on the right side of the heart. In preparations of the thrombi from the left ventricle he saw what looked like staphylococci.

UNUSUAL DEGENERATION OF THE LIVER.

Prof. O'SULLIVAN said the patient from whom the liver was taken was a middle-aged man who had had two attacks of jaundice. He was under the care of Dr. Walter Smith and Sir Charles Ball. The latter operated and found the common bile duct and gall-bladder perfectly empty. There was no evidence of obstruction or of bile to be seen anywhere. The liver weighed 4 lbs. 5 ozs., was larger than normal, of a greenish-yellow colour, and the capsule was smooth. On section it showed greenish-yellow areas, separated by lines of red material. Microscopic examination showed that the centre of the lobule was degenerated, and a zone of comparatively healthy liver cells was to be seen towards the periphery. The degenerated cells in the centre showed an almost entire absence of protoplasm, and their nuclei were shrunken and deformed. A great many cells were filled with granules of bile pigment, and the bile capillaries were filled with plugs of inspissated bile. There was no inflammation of the smaller bile ducts, and no sign of increased connective tissue formation. The cells were separated from each other and had lost their columnar arrangement. No bacteria were found. In ordinary fatty liver the fatty change was at the periphery of the lobules. It seemed possible, in cases where the bile capillaries were plugged, that the degeneration of the liver cells might be due to poisoning by the bile acids produced by the cells themselves.

Prof. MCWEENEY said the outer cells of the lobules also looked degenerate. They did not give a very good nuclear stain. He would like to have seen the appearance of the lobules in preparations stained for fibrin and fat.

Dr. FINNY said he saw this man in consultation the day before he died. There was no evidence of phosphorus poisoning.

Prof. WHITE said he saw a case three or four years ago which, in a certain manner, resembled the one under discussion. The patient died of sub-acute yellow atrophy. The liver showed red and yellow patches. In the red patches there was no formed connective tissue, but a small amount of granulation tissue. He

did not see why this liver should not be classed with "yellow atrophy"—a condition which, in less severe forms, he thought was more common than was generally supposed. The absence of a large amount of fat in sections stained with osmic acid or Soudan iii. would not prove that the liver cells had not undergone complete fatty degeneration, as the fatty products are quickly enough removed.

Dr. O'CARROLL spoke of the tendency to consider the liver at fault when anything went wrong, and no other organ could be made out to be affected.

Prof. O'SULLIVAN, in reply, said the osmic acid sections which he had made had partly failed owing to imperfect penetration of the osmic acid; but even in the imperfect sections obtained the presence of fat was quite discernible. The experiments of Rosenfeld seemed to show that even in toxic degenerations the fat found in the liver cells was mainly deposited from the blood.

ASPERGILLUS FUMIGATUS IN EYE.

Dr. H. C. MOONEY exhibited specimen with culture of *aspergillus fumigatus* in the eye, caused by an oak husk sticking on cornea of an agricultural labourer. After cautery was applied, the patient got well. Only sixteen or seventeen cases of the kind have been recorded, two of which occurred in the United Kingdom.

Prof. MCWEENEY said he had seen *aspergillus fumigatus* occurring in the auditory meatus.

Dr. H. C. MOONEY exhibited and showed sections of non-pigmented flat sarcoma of the chorioid.

PRIESTLEY SMITH'S NEW METHOD OF PRESERVING EYES FOR MUSEUM PURPOSES.

Dr. H. C. MOONEY described the method and demonstrated its advantage over the older gelatine and gelatine and formalin methods.

BACTERIAL ASSOCIATION IN A CASE OF SPREADING EMPHYSEMATOUS GANGRENE.

Prof. MCWEENEY stated that the patient was a youth, *æt.* 18, admitted under the care of Mr. McArdle to St. Vincent's Hospital, suffering from compound fracture of the right humerus, the result of a hunting accident. He was unconscious, and within four hours of the accident the temperature rose to 108°, evidently from shock to the medulla. Despite careful cleansing and replacement of the bones the arm became swollen and glazed after twenty-four hours, sero-sanguineous discharge came on, which became fetid, the limb became dark and brawny, and emphysema occurred round the shoulder-joint. Owing to the brain condition, amputation was out of the question. Free opening of the cellular spaces of the arm gave issue to the fluid, which was examined. The side of the chest and neck became emphysematous, and death occurred in four days after receipt of the injury. Bacteriological examination by anaerobic agar-plates in a Bulloch's apparatus yielded three organisms. One was a streptococcus, one a bacillus resembling *B. coli*, and the third was *Bacillus aragenes capsulatus* of Welch and Nuttall. This proved to be a large, anthrax-like, motionless rod with rounded ends, staining well with Gram; spore-formation not observed though it must have been present on the bacilli Gram from portion of exudate that had been heated to 80° C. for ten minutes. They formed flocculent whitish colonies in gelatine and agar. The former crustations were not liquefied but only softened. Much gas formation. A rabbit injected intravenously with 1 cc. of the broth culture and then killed, and the body kept warm overnight, showed enormous distension of the solid viscera with gas bubbles ("foaming" organs). He now showed some of these organs [demonstration]. Curiously, he had failed to induce the bacillus to grow on Löffler's serum or in blood outside the body. The gas had a slight odour of rancid butter. The coli-like bacillus could not ferment any sugar, and was an alkali-former—in fact, the only feature in which it resembled *B. coli* was its colonies on gelatine. It was a very short non-motile rod, often resembling an oval diplococcus. If intra-peritoneally inoculated it produced purulent peritonitis in a rabbit, which, however,

recovered. The streptococcus grew abundantly on gelatine, made broth diffusely turbid, and was non-pathogenic for rabbits by itself, but injected along with the coli-like bacillus it killed them. Cultures and microscopic preparations of all three organisms were demonstrated.

Prof. McWEENEY exhibited two brain tumours—one being an angio-sarcoma (perithelioma) of the right *centrum ovale*, the other an encapsuled sarcoma of the pons.

Prof. McWEENEY showed blood films of leukæmia due to large mononuclear leucocytes.

CENTRAL MIDWIVES BOARD.

MEETING HELD MAY 24TH.

The President, Dr. CHAMPNEYS, in the Chair.

MIDWIVES AND THE DUBLIN MATERNITY HOSPITALS

At the beginning of the meeting a letter was read from the Clerk of the Council enclosing copy of a resolution passed by the Board of the National Maternity Hospital, Dublin, in favour of Examinations in Dublin, and one to the same effect from the Rotunda Hospital.

The CHAIRMAN remarked that this had been sprung upon them rather suddenly, and as he did not want to be too abrupt and say they could not do it, he thought it would be better to return an answer that the resolution passed on May 10th would be put into effect as soon as Ireland was within the Act, and a small committee would be called on to consult on the matter.

Sir WM. SINCLAIR said they would be giving Ireland all the advantages and none of the drawbacks. He thought a careful answer should be drawn up and presented to the Lord President, and this resolution was passed unanimously.

The SECRETARY then stated that the Whitechape Guardians had inquired as to the requirements of the Board in order to render the Maternity Ward fit for a training college, to which answer was returned to Sir Shirley Murphy asking if Dr. Wankley could see his way to suggesting the necessary structural alterations and to report thereon to the Board. A letter was read from Dr. Wheatley, County Medical Officer for Shropshire, asking whether midwives who have notified the Local Supervising Authority that they intend only to practise as monthly nurses are subject to obligations imposed by the Rules. Answer was returned that they would no longer be under inspection, have to keep a register, or carry appliances.

MIDWIVES ACTING UNDER DOCTORS.

The question next under discussion referred to the necessity for a midwife acting under a doctor to report a case.

Miss PAGET thought the doctor was responsible.

Dr. PARKER YOUNG said that when women were treating cases on their own responsibility they were responsible until a doctor was called in, when the responsibility devolved on him.

Mr. WARD COUSINS considered the midwife responsible in her double functions of midwife and nurse.

Dr. PARKER YOUNG and Dr. DAKIN said they would not care to employ a woman who had to report all details of the case to the Local Supervising Authority, and it was ultimately agreed that the nurse's public responsibility ceased when the doctor was called in.

With regard to the matter of journey expenses for Examiners, raised at a previous meeting, the following extra fees were fixed:—

Cardiff to Bristol and back	£2 2
Birmingham " " " "	4 4
Liverpool to Manchester and back ..	2 2
Leeds to Newcastle and back	5 5

APPLICATIONS FROM POOR LAW INSTITUTIONS.

After the reading of the memorandum concerning Poor Law Institutions and their efficiency as training schools,

Sir WM. SINCLAIR said he objected to every clause in it. It was not true that an Institution, if allowed

to train, obtained a better class of probationers. He had had 25 years' experience and found the workhouse midwife inhumane and rough; moreover the teachers were often inexperienced, and there was no reason why women should not come up to the larger schools. A slur also had been cast on local inspectors. He had always found them faithful, and they certainly could have no object in stating an untruth.

Miss PAGET (also speaking from experience) replied she had found workhouse midwives quite equal to others, and at the Queen Victoria they were preferred, being most kind and capable.

Miss WILSON agreed, saying there were 800 workhouses and infirmaries, whose nurses had been a great boon to the community.

Sir WM. SINCLAIR answered that he had no doubt they were respectable, but if questioned it was a very different story, as they showed great ignorance.

Miss PAGET added that the women could not come to London to be taught as there were not sufficient schools; and this the Chairman confirmed, remarking that the London took a few, but not many, and those in the other hospitals were chiefly for the benefit of students.

The meeting then considered the report of the Penal Committee, and the PRESIDENT announced that new offices had been taken in Caxton House, Westminster.

GENERAL MEDICAL COUNCIL.

FIRST DAY.—TUESDAY, MAY 22nd, 1906.

DR. MACALISTER, President, in the Chair.

THE official notification of the election of Leonard Kidd, Esq., M.D., as Direct Representative for Ireland reported to the President as returning officer on February 16th, 1906, was read.

Dr. Kidd was introduced by Dr. Little.

The PRESIDENT delivered the following address:—

GENTLEMEN,—One change only has occurred in our membership since the last session, though I understand that other changes are imminent. Sir William Thomson, who for ten years had filled an honoured place in the Council as a Direct Representative for Ireland, ceased to hold office on February 28th. An election was accordingly held, in pursuance of the Medical Act, 1886, and under the regulations made by the Privy Council, during the month of January. The candidates nominated were Sir William Thomson and Dr. Leonard Kidd, of Enniskillen. As the result of the first scrutiny of the votes, the Branch Council for Ireland found that the number of voting papers whose validity was regarded as doubtful exceeded the difference between the numbers of apparently valid votes recorded for the two candidates respectively. The Branch Council was thus unable, without further inquiry, to certify to me as returning officer the result of the election. In the circumstances, I thought it proper to suggest that a recount should be made, with the aid, if necessary, of a legal assessor. The suggestion was adopted, and in the end Dr. Leonard Kidd was certified to be duly elected. In your name I bid him welcome to the Council, as the representative of the registered Medical Practitioners of Ireland. But we cannot part with Sir William Thomson without expressing our appreciation of the valuable service which since 1896 he has rendered to the Council, to the profession, and to the State. His courtesy, his independence of view, his impressive speech, and his zeal for the interests of his professional brethren in Ireland will long be remembered by all with whom he was here associated. I am glad to have his assurance that he has recovered from the illness which disabled him during the election, and that his experience of the fortunes of war, acquired in other and sterner fields, now stands him in good stead. In November I called your attention to the probability that some of the Canadian Provinces might, in pursuance of the amending Medical Act of 1905, make application for the extension to them of the privileges

of medical reciprocity with the United Kingdom. The first to seek admission is the Province of Nova Scotia. His Majesty the King has been satisfied that the provincial laws afford an equitable basis for the grant of reciprocal privileges, and accordingly on May 11th an Order in Council was made applying Part II. of the Medical Act, 1886, to that part of the Dominion of Canada. I have already forwarded a request, through the Secretary of State for the Colonies, for particulars of the conditions, as to study and examinations, under which medical diplomas are granted in Nova Scotia. These particulars will in due course be laid before you, in order that you may satisfy yourselves regarding the sufficiency of the qualifications and give directions for their registration in the Colonial List. In my own opinion it is highly desirable, in the interest of the Dominion itself, no less than in that of the Empire at large, that closer professional relations should be established between the mother-country and her daughter-states beyond the seas. From recent minutes of the Executive Committee it will be seen that legislation for the better control of medical practice, and for the effective recognition of our own registrable qualifications, is making constant advances in the several Crown Colonies of the Empire. It will, I am sure, be welcome to the Council should the rest of the Canadian Provinces see fit to follow the example of Nova Scotia, and so enable us to unite all the self-governing Colonies with ourselves in one bond of mutual recognition and mutual privilege. I have accepted an official invitation to visit Canada during the summer, and I hope to have the opportunity of conferring on the question of medical reciprocity with some of the authorities there who desire further explanations of its scope and purport. It will be gratifying if the result is to accelerate the movement which, by the action of the maritime Province, has now auspiciously begun. By an Order of His Majesty in Council, dated December 11th, the Medical Act of 1886 was applied to the Empire of Japan. Full details respecting the prolonged course of preparatory and professional study and examinations required for the medical degrees of the Imperial University have now been obtained through the Foreign Office. I have prepared for the use of the Executive Committee and of the Council a memorandum on the subject, in which these details are set forth. You will probably be of opinion that the conditions for University graduation in Japan are amply sufficient to guarantee the efficiency of its bachelors and doctors of medicine. Complete information regarding the other avenues to medical qualification in that country is not yet to hand; but so far as our information goes, it shows that our Japanese Allies have provided wisely and fully for the education of their practitioners in the science and art of Western medicine. Let me add that it also does much to explain the unparalleled efficiency and success of their military medical service in the recent war. It is not too much to say that the surgeons and sanitary officers of the Japanese forces have proved themselves capable of teaching many wholesome practical lessons to the nations of the West.

You will permit me to mention, before leaving the subject of international relations, a recent personal experience of my own. Last month I was invited, as your President, and as deputy for the Vice-Chancellor of the University of Cambridge, to be present in Rome at the ceremonial opening of the magnificent group of clinical schools and laboratories known as the *Polichinico* and at the festival then held in honour of Professor Guido Baccelli, its founder and director. Having been also accredited by the Lord President of the Privy Council, I was received as the representative of this country, and with other foreign delegates had the honour of delivering in the Capitol, before his Majesty King Victor Emmanuel and his Ministers, an address of congratulation to Professor Baccelli and to the University of Rome. As the Council is aware, Italy alone of European nations has entered into an agreement of reciprocity with us, in respect of medical registration. His Majesty was pleased to note the fact with satisfaction

and graciously offered me a special welcome on that account. During the subsequent proceedings, the close professional relations between Italy and the United Kingdom were frequently referred to, and always with cordial expressions of goodwill. It was impossible to resist the impression that the council, by recognising for registration the medical degrees of the Italian Universities, had made an important contribution to the traditional comity existing between the two nations. In September next the University of Aberdeen celebrates its four-hundredth anniversary, and I have been favoured, as President of the Council, with an invitation to take part in the ceremonies. On the occasion of the four-hundred-and-fiftieth anniversary of the University of Glasgow, the Council forwarded its congratulations and good wishes to that University (Minutes, 1901, p. 210). Should this precedent be followed, I shall be glad to receive your instructions for the preparation and presentation of a suitable address to the ancient University of Aberdeen. The Lord President has forwarded for our consideration a petition for a charter of incorporation, submitted to the Privy Council by the British Optical Association, and a copy of a Bill, entitled "The Sight-Testing Opticians Bill," now before the House of Lords. Both documents propose that powers and privileges shall be conferred on certain persons, who are not qualified medical practitioners, in relation to the diagnosis and treatment of ocular defects. As the proposals touch closely the practice of ophthalmic medicine and surgery they will doubtless receive your careful scrutiny. At my request, a confidential memorandum has been prepared on the subject as an aid to your consideration; you will probably find it a useful summary of the facts which have to be kept in mind. The Privy Council has also sent to the Council, for this purpose represented by the English branch, a draft of the revised Rules framed by the Midwives Board. Many important modifications have been made in the Rules, as the result of the experience gained by the Board since 1903. Under the Midwives Act 1902, the branch council is entitled to make representations on the revised text, and these must be considered by the Privy Council before the rules are approved as valid. A draft of the Supplemental Charter which is being sought from His Majesty in Council by the University of Wales was before the Executive Committee in February. The Charter, if granted, will empower that University to establish a Faculty of Medicine and Surgery, and to grant degrees and diplomas in the faculty. I have ascertained that the intention of the University authorities is to require that candidates for medical degrees shall have studied in one of the colleges of the University as matriculated students for not less than three years of the whole medical course, and that they shall have graduated in arts or science before graduating in medicine or surgery. The Executive Committee were of opinion that no objection should be raised to the grant of the Charter, but pointed out that the degrees conferred in virtue of its powers would not be registrable qualifications, in the absence of an Act of Parliament amending the Medical Acts in that sense. If precedents are followed such an Act will contain a clause empowering the University of Wales to appoint an additional member of this Council. The addition will bring our number up to thirty-five. As the Council chamber is even now inconveniently crowded its extension becomes an urgent necessity. The office site committee, acting on the powers entrusted to it, has completed an arrangement whereby the council may at once resume possession of the reserved portion of our Hanover Square site. In view of the commencement of building operations there the committee has thought it opportune to obtain plans and estimates for the enlargement during the summer of our present chamber. These the committee will submit to you during the session. We may therefore hope that in November we shall be able to meet in greater comfort and convenience than is now possible. Fortunately the expense of the improvement, which I think is inevitable, will fall upon us at a time when we

can bear it without difficulty. The accounts of the past year are already in your possession, and I am happy to say that for the first time since 1895 they show a surplus of income over expenditure. The amount of the surplus is £907; it is due partly to an increase of income, but in greater part to a decrease of expenditure due to the expedition with which the Council carried through the business of its two sessions in 1905. Owing to the election of direct representatives in the current year an exceptional charge of considerable amount will have to be met by the branch councils, and it is therefore incumbent on us to persevere in our course of economy in so far as it is compatible with the full and efficient discharge of our statutory duties. One method by which our sittings may be kept within convenient limits has been in active operation during the present year. I refer to the careful preliminary consideration by the standing and special committees of important subjects remitted to them. Digests, memoranda, and draft reports have been prepared and circulated in good time to members, who have thus had the opportunity of coming to a conclusion on the questions raised, and of offering reasoned recommendations to the Council concerning them. To the Chairmen of committees and to the Council's officials our grateful acknowledgments are due for much preparatory work of this kind. Reports by the education and examination committees, and by the practical midwifery committees have been drawn up on this plan and will be submitted to you at the present meeting. It would, in my opinion, conduce to the value of our discussions in full Council were they in most cases confined to question of principle, on which, of course, the decision of the Council must be clear and authoritative; questions of detail might then be left to the Committees to work out at leisure. Power to deal with details has already been given to the Pharmacopœia, Education, and Students' Registration Committees, and in view of the great increase in the size of the Council within recent years, it is worth considering whether the practice might not with advantage be extended. It would also facilitate the arrangements of the Committee meetings if, so far as is practicable, the membership of each standing committee were independent of the others. I commend the suggestion to the Branch councils, with whom rests the duty of nominating standing committees. The Executive Committee also will present reports on certain points affecting your standing orders. Regarding the practice and constitution of the Penal Cases Committee, Dr. Finlay has given notice of an important motion. If I am in order in alluding to the subject from the Chair, I would say that in my opinion the full committee of nine, with the solicitor and legal assessor, who are always present, is unnecessarily large for the purpose in view. As a matter of practical experience the statutory dental committee of five, with the same legal assistance, is found to be sufficient and efficient, though it has to act not only as a committee of advice with reference to penal cases, but also as a court of first instance for ascertaining the facts. I see no disadvantage, and some substantial advantage, in reducing the Penal Cases Committee to five members, two from England, one from Scotland, and one from Ireland, with the President. If this were done the objection felt by your legal advisers and by the Executive Committee to the mere rescission of Chapter IX., 5 (ii.) of the Standing Orders would be removed; and our practice under the Medical Acts would be assimilated to our practice under the Dentists Act. Under instructions from the Companies Bill Committee I have had prepared two drafts, one of a "Prohibition of Medical Practice by Companies Bill," the other of a "Dental Companies (Restriction of Practice) Bill." In their preparation I have had the active co-operation of your legal advisers, and the friendly help of Mr. Muir Mackenzie. Sir John Batty Tuke and other members of Parliament, in both Houses, have also afforded me the advantage of their practical experience and counsel as to the best method of presenting the Bills to Parliament. It will be enough here to say that the Bills are now ready, and that there is reason

to hope that they may be introduced during the present Session. Some of the disciplinary cases with which you will have to deal, and which present certain features of novelty in detail, will serve to bring home to the members of the Council the gravity of the situation arising from the unrestricted exercise of the skilled professions by joint-stock companies. The Council, within the sphere of its jurisdiction, can do something, the ordinary law of conspiracy or of fraud can do something more to place obstacles in the way of flagrant abuse of the Companies Acts. But, as our experience accumulates, it becomes ever plainer that a change in the law is the only means whereby the public interest can be effectively safeguarded against the ingenious evasions that are possible under the existing law of corporate irresponsibility.

Moved by Dr. LITTLE, seconded by Dr. NORMAN MOORE and carried by acclamation: That the President be thanked for his address and requested to let it be printed in the Minutes.

Moved by Dr. NORMAN MOORE, seconded by Dr. BRUCE, and agreed to: That the Council do adjourn at 4 p.m. to enable certain committees to meet for the completion of their Reports.

Moved by Dr. NORMAN MOORE, seconded by Sir PATRICK HERON WATSON, and agreed to: That eight yearly tables showing the results of professional examinations for 1905 be received and entered on the Minutes.

Moved by Sir PATRICK HERON WATSON, seconded by Dr. McVAIL and agreed to: That the thanks of the Council be conveyed to the Director-General of the Medical Department of the Royal Navy, the Director-General of the Army Medical Service, and the Under Secretary of State for India respectively for the returns which they have again furnished to the Council, with the request that these returns may in the future continue to be furnished to the General Medical Council.

Moved by Dr. NORMAN MOORE, seconded by Mr. THOMSON, and agreed to: That the Report from the Executive Committee on the Dental business transacted since the last meeting of the Council be received and entered on the Minutes. The report referred to—

1. The names of the following persons, the prescribed conditions having been duly fulfilled in each case, are restored to the Dentists' Register—G. M. Brown, Samuel Halliday, George F. Hare, William Lait, William Taylor, Vivian E. Turner.

2. The intention of Sir John Batty Tuke to reintroduce in the House of Commons the two Bills relating to the practice of Medicine and Dentistry by limited liability companies.

3. Copy of a despatch from the Governor of Hong-Kong enclosing the draft of an ordinance to regulate the qualifications and to provide for the registration of Dentists in the Colony.

Moved by Dr. NORMAN MOORE, seconded by Dr. BRUCE and agreed to: The Report of the Executive Committee: That in virtue of the authority conferred on the Executive Committee of the G.M.C. the Committee now instruct the Registrars to accept for registration as an additional qualification the degree of B.Sc. in public health of the University of Glasgow.

Moved by Dr. NORMAN MOORE, seconded by Sir THOMAS MYLES, and agreed to: That the Report received from the Council's solicitor with reference to the Standing Orders with regard to the summoning of the Penal Cases Committee, be received, entered on the minutes and approved. The opinion negated any alteration being made in the summoning of the Penal Cases Committee.

Moved by Dr. FINLAY, seconded by Sir V. HORSLEY and agreed to:—

1. That the Clause in Standing Orders—"The President shall be empowered not to summon the Scottish or the Irish members of the Committee, as the case may be, unless any complaint forwarded from Scotland or from Ireland has been presented for consideration be rescinded."

2. That the number of the members of the Penal Cases Committee be reduced from 8 to 4.

3. That the Penal Cases Committee consist of two members from England, one from Scotland, and one for Ireland.

Moved by Dr. NORMAN MOORE, seconded by Dr. Finlay and agreed to: That it be remitted to the Executive Committee to amend the Standing Orders in accordance with the foregoing resolutions.

Moved by Sir JOHN WILLIAM MOORE, seconded by Sir V. HORSLEY, and agreed to: That the quorum of the Penal Cases Committee be three.

Moved by Dr. NORMAN MOORE, seconded by Mr. Thomson and agreed to that the Report of the Executive Committee with regard to the present position of the question of the application of Part II. of the Medical Acts, 1886, to the Empire of Japan be received and entered on the Minutes—The degrees of Bachelor (Igakushi) and Doctor (Igaku Hakushi) of medicine of the Imperial University of Japan be recognised by the Council as entitling to Registration in the foreign list of the Medical Register, the applicant to produce (1) satisfactory evidence of identity; (2) satisfactory evidence of good character; (3) satisfactory evidence that he is by the law of Japan entitled to practise medicine, surgery, and midwifery in that country; (4) the diploma of Bachelor or Doctor of Medicine of the Japanese Imperial University; (5) satisfactory evidence in relation to the circumstances 1, 2, 3, set forth in Section 12 of the Medical Act 1886; (6) officially attested translations of such Japanese documents as are produced under any of the foregoing heads.

On motion from the Chair, it was resolved unanimously that the report be adopted.

The Council then sat *in camera*, and subsequently adjourned.

SECOND DAY.—WEDNESDAY, MAY 23RD, 1906.

Dr. MACALISTER, President in the Chair.

The Minutes of the last meeting having been read and confirmed, the Council considered *in camera* a report of the Executive Committee in regard to an application for the restoration of a name after erasure under section 29 of the Medical Act, 1858. On ceasing to sit *in camera* the Council proceeded to the consideration adjourned from November 29th, 1905, of the facts proved against William Harding Crowther, registered as of 15, Bloomfield Road, Ealing, London, L.S.A. Lond., 1876, L.F.P.&S.Glas., 1880, who had been summoned to appear before the Council to answer the following charge as formulated by the Council's Solicitor:—

"That you have systematically sought to attract patients by means of a series of advertisements in the *People* newspaper of an Institution for Stricture, &c., at 8A, Guilford Street, Gray's Inn Road, of which you are the surgeon, and which is carried on for your private gain."

At the conclusion of the deliberation of the Council on the case on November 29th, 1905, the President announced the decision of the Council as follows:—

"The Council have carefully considered the facts alleged against Mr. William Harding Crowther in the Notice of Inquiry, and have found that they have been proved to their satisfaction; but they have adjourned the further consideration of the case until the next session in order that Mr. Crowther may have an opportunity of appearing before the Council and giving an account of his conduct in the interval. Meanwhile Mr. Crowther will be required to furnish at once a medical certificate in regard to his state of health."

This certificate was supplied as required.

Mr. Crowther did not attend in answer to his notice, but was represented by Mrs. Crowther, who attended to answer any questions which the Council might desire put to her.

Dr. Woods attended on behalf of the London and Counties Medical Protection Society, the Complainants.

The solicitor having read the notice to attend, Dr. Woods stated, in answer to a question put from the chair, that he had no new facts to adduce.

The Solicitor having read a letter from Mr. Crowther, together with a certificate from Dr. H. H. Tooth, of 34, Harley Street, W., and a testimonial from the

Rev. W. Theodorice Vale, of Kissingbury Rectory, Northampton.

Mrs. Crowther made a statement on behalf of Mr. Crowther, and answered questions put to her from the Chair, and by a member of the Council through the Chair.

Strangers having, by direction of the Council, withdrawn, the Council deliberated on the case *in camera*.

Dr. Woods, Mrs. Crowther, and strangers having been re-admitted, the PRESIDENT announced the decision of the Council as follows:—

"Mrs. Crowther, I have to inform you that the Council have given careful consideration to this case, and that they have decided *not* to direct the Registrar to erase from the Medical Register the name of Mr. William Harding Crowther."

4. The Council proceeded to the consideration, adjourned from November 30th, 1905, of the fact proved against Hamlet Lloyd Davies, registered as of 2, Crofton Street, Great Western Street, Rusholme, Manchester, M.B., Mast. Surg. 1874, Univ. Edin., who had been summoned to appear before the Council to answer the following charge as formulated by the Council's Solicitor:

"That you have accepted and continued to hold the appointment of paid Medical Officer to the Rusholme and District Provident Dispensary, an Association which systematically practises canvassing for the purpose of procuring patients."

At the conclusion of the deliberation of the Council on the case on November 30th, 1905, the PRESIDENT addressed Mr. Davies as follows:—

"Mr. Davies, the Council have deliberated very carefully on your case, and they have come to the conclusion that the facts alleged against you in the notice of inquiry have been proved to the satisfaction of the Council. The Council feel it their duty to express their sense of the gravity of the facts which have been proved against you; but, in order to give you an opportunity seriously to reconsider your position in relation to the Rusholme and District Provident Dispensary, they have adjourned the further consideration of the charge until the next Session, when you will have to appear and satisfy the Council as to your conduct in the interval."

Mr. Davies did not answer to his notice, and Dr. Bateman, on behalf of the Medical Defence Union, the Complainants, did not appear. The Solicitor read the notice to attend and Mr. Davies' answer to the notice. Strangers having, by direction of the Council withdrawn, the Council deliberated on the case *in camera*. The case was adjourned for consideration to Saturday, May 26th.

Strangers having been re-admitted, the Council proceeded to the consideration of the case of John Bate Bowden, registered as of Mountain View, Blaenavon, Mon., M.B., Mast. Surg. 1884, M.D., 1886, Univ. Edin., who had been summoned to appear before the Council to answer the following charge, as formulated by the Council's Solicitor:—

"That you accepted and held until after you had received notice of the present complaint, the appointment of paid medical officer of the Blaenavon Tradespeople's Doctor's Fund, an Association which systematically practises canvassing for the purpose of procuring patients."

Dr. Bawden attended in answer to his notice. Mr. Charles Parnham Skrimshire and Mr. Arthur Blair Avarne attended in support of their complaint.

The Solicitor having read the notice to attend, Mr. Skrimshire opened the case for the complainants. He read a statement of the facts which he had prepared, and tendered certain letter-cards which he alleged had been left by Dr. Bawden with persons canvassed after the Blaenavon Tradespeople's Doctor's Fund had ceased to exist. Mr. Avarne also read a statement which he had prepared in support of the complaint. He then tendered himself as a witness as to the accuracy of his statutory declaration, which he read. He also identified a letter-card which had been sent to a patient by Dr. Bawden after the termination of the fund.

Mr. Avarne answered a question put to him by Mr. Skrimshire. He was cross-examined by Dr. Bawden.

Mr. Skrimshire then tendered himself as a witness in support of the accuracy of his declaration. Dr. Bawden did not desire to cross-examine him. Mr. Skrimshire identified a letter-card which had been sent out by Dr. Bawden, and answered questions put to him, through the Chair, by members of the Council.

Mr. Skrimshire put in statutory declarations which had been made by Mr. John Jones, of 24, Broad Street, Blaenavon; Mr. William Merriman, of Park Street, Blaenavon; Mrs. Rosetta Minchin, of the Ivor Castle Hotel, Blaenavon; two declarations by Mr. Henry Jeffrey Jones, of Woodbine Cottage, Blaenavon; another Declaration by Mr. John Jones, of 24, Broad Street, Blaenavon. Dr. Bawden, in answer to questions put from the Chair, stated that he did not challenge these declarations.

Dr. Bawden then addressed the Council on his own behalf, and read letters which he had written to the Registrar before the complaint was made against him, and in answer to the Registrar's request for an explanation. Dr. Bawden then tendered himself as a witness and answered questions put to him by Mr. Avarne. Mr. Skrimshire did not desire to put any questions to Dr. Bawden. Dr. Bawden then answered questions put to him, through the Chair, by members of the Council. This closed Dr. Bawden's case. Dr. Bawden answered questions put to him by the Legal Assessor.

Mr. Skrimshire then addressed the Council in reply. Mr. Avarne did not desire to make any observations. Strangers then, by direction of the Council, withdrew in order that the Council might deliberate on the case *in camera*.

Dr. Bawden and strangers having been re-admitted, the PRESIDENT announced the decision of the Council as follows:—

"Dr. Bawden: It is my duty to inform you that the Council, after careful consideration, have come to the following decision:—That the facts alleged against you in the Notice of Inquiry have been proved to the satisfaction of the Council; that the Council judges you to have been guilty of infamous conduct in a professional respect, and directs the Registrar to erase from the Register the name of John Bate Bawden."

Strangers then, by direction of the Council, withdrew in order that the Council might deliberate on certain items of business *in camera*.

The Council subsequently adjourned.

THIRD DAY—MAY 24TH, 1906.

Dr. MACALISTER, President, in the Chair.

The Minutes of the last meeting were read and, as amended, confirmed.

The Council then proceeded to the consideration adjourned from December 1st, 1905, of the facts proved against John Jones Atwood, Thomas Rose Smart, Walter Bennett, Montague Alex Levason and Daniel Shea whose names all appear on the Dentists' Register as "in practice before July 22nd, 1878," and who were connected with the Company of Guy White and Co., Ltd. The Dental Committee on May 18th, 1906, after having heard evidence tendered by Messrs. Atwood, Levason, and Shea, and considered letters from Messrs. Levason, Shea, Smart, and Bennett, found that the following facts were thereby established: The said J. J. Atwood, T. R. Smart, W. Bennett, M. A. Levason, and D. Shea have all severed their connection with G. Guy White and Co., Ltd., the company their association with which was the subject matter of the complaint, and none of them has since had any connection with this or with any similar company. Resolutions for the winding up of the company have been passed and registered at Somerset House. All these gentlemen attended in answer to their notice excepting Mr. Smart. Mr. Shea in addressing the Council stated that he had nothing to add to his former explanations to which he adhered; the other accused practitioners did not desire to make

any statements. Mr. R. W. Turner, Counsel of the British Dental Association, said that his inquiries substantiated the statements of the accused practitioners as to their conduct in the interval. After the Council had deliberated *in camera*, the PRESIDENT, when strangers had been re-admitted, announced the judgment of the Council as follows: "The Council having further considered the charge proved against J. J. Atwood, J. R. Smart, W. Bennett, M. A. Levason, and D. Shea and the Reports of the Dental Committee thereon, does not judge you guilty of infamous or disgraceful conduct in a professional respect."

The Council next proceeded to the consideration of the Report of the Dental Committee on the charge against George Charles Smith. The Committee held the inquiry on May 18th, 1906, to ascertain the facts. The accused practitioner, who is on the Dentists' Register as in practice before July 22nd, 1878, and whose address on the Register is 153, High Street, Lewisham, London, S.E., did not attend and was not represented. He has been in practice in Lewisham for the last twenty-one years, and claims to have the largest practice in South London. Mr. Smith recently entered into an arrangement with a Mr. Farkasch for the purpose of extending his practice by a system of canvassing by paid canvassers organised and superintended by Mr. Farkasch. The canvassers distributed documents from house to house containing order forms for signature, addressed to Mr. Smith, with schedule of charges for dental operations and for supplying artificial teeth, and subsequently called to solicit signatures to these order forms and to receive deposits in respect thereof. The canvassers on these visits examined the mouths of persons who permitted them and advised them as to their requirements and gave estimates of cost. From twelve to twenty persons were employed to canvass for Mr. Smith's dental practice. Mr. Farkasch is not a qualified dentist, but he carries on a dental practice under the name of the "Hygienic Institute" at Glasgow and elsewhere by a similar system of canvassing, and carries on the practice by unqualified assistants. For the purpose of organising the system of canvassing on behalf of Mr. Smith, Mr. Farkasch opened an office at 142, High Street, Lewisham, opposite Mr. Smith's surgery, and Mr. Smith's name appears on this door as well as on Mr. Smith's surgery. Mr. Smith employs unqualified assistants at 153, High Street aforesaid, who are in the habit of conducting dental operations on patients at Mr. Smith's surgery, and extract teeth at the private residences of patients who have signed orders in the form above mentioned. Mr. Smith states that he does not wish to defend his right to remain on the Register. The evidence before the Committee consisted of (1) Statutory declarations by the following persons:—(a) Mr. Frederick Powell, (b) Mr. Frederick Joseph Gardner. (2) A letter from Mr. Smith to the Registrar, dated April 30th, 1906. (3) A further letter from Mr. Smith, dated May 16th 1906. (4) A letter from Mr. Farkasch to the Dental Committee, dated May 17th, 1906.

Mr. R. W. Turner, Counsel, instructed by Messrs. Bowman and Curtis-Hayward, Solicitors, addressed the Council on behalf of the British Dental Association and the Council having deliberated *in camera*, the PRESIDENT, on strangers being re-admitted, announced the decision of the Council to Mr. Smith, who was now present, as follows: "Mr. George Charles Smith—On the facts found in the Report of the Dental Committee it has been proved that you have been guilty of conduct which is infamous and disgraceful in a professional respect, and the Council directs the Registrar to erase from the Dentists' Register the name of George Charles Smith."

The Council proceeded to the consideration of the Report on the charge against William MacGregor Veitch, L.D.S.R.C.S.Eng., 112, Prince's Road, Liverpool, and Thomas Wafer Byrne, L.D.S., R.C.S.Eng., L.D.S., F.P.S.Glas, 2, Prince's Road, Liverpool. The inquiry by the Dental Committee took place on May 18th, 1906. The accused

practitioners appeared and were represented by counsel and solicitors. The report was as follows :

The Committee find that the following facts were established by the evidence :—

(1) The Practitioners complained of are on the Dental Register with the qualifications above set forth—Mr. Veitch at 112, Prince's Road, Liverpool, and Mr. Byrne at 2, Prince's Road, Liverpool.

(2) Mr. Veitch and Mr. Byrne respectively carried on practice as Dentists in their own names at their registered addresses, but they also carried on a dentist's practice under the name of Entwistle Bros., Ltd., at 218A, London Road, Liverpool, and also at Seacombe. They were the only two Directors and Mr. Veitch was the Secretary of the Company, and, with nominal exceptions, they held the whole of the shares.

(3) Mr. Veitch and Mr. Byrne purchased the goodwill of this business from the representatives of deceased dentists of that name, who had carried on a dental practice for many years previously. The Company employed an expert advertiser of the name of Kelly, who had complete control of the advertising department. The company issued advertisements and circulars of an objectionable character, and containing claims of superiority over other practitioners.

(4) The Company employed an unregistered assistant named James Kermod Goldsmith, who attended patients and performed dental operations at 218A, London Road, aforesaid. Mr. Goldsmith was registered as a Dental Student in July, 1894, and had passed all his examinations except the final examination, and had gone through a course of practical dentistry at the dental hospital. Mr. Veitch or Mr. Byrne attended daily at the premises in London Road, with which they were in telephonic communication, and they superintended or performed the more serious operations. Their instructions to Mr. Goldsmith were to do the mechanical work of an unqualified assistant, but Mr. Goldsmith did not, as he admitted, in practice follow these instructions, but performed dental operations under gas administered by himself on his own responsibility.

(5) Both Mr. Veitch and Mr. Byrne retired from the directorship, and parted with their shares in the Company on April 2nd, 1906. The complaint against them was made on April 27th, and they were asked by the Registrar for an explanation on April 30th. In reply to the complaint and when under examination they expressed their unqualified regret for their mistaken conduct, and contended that the advertisements were directed against unqualified competitors.

The evidence before the Committee consisted of the following :—(1) The oral evidence of the following persons—(a) Mr. Charles Bowen, (b) Mr. Veitch, (c) Mr. Byrne, (d) Mr. Goldsmith. (2) Five statutory declarations. (3) Four documents. (4) A letter from Herbert J. Davis, the solicitor for the accused practitioners. (5) Copy of the annual return of the company made up to May 11th, 1906, and filed.

Both Mr. Veitch and Mr. Byrne addressed the Council and Mr. B. W. Turner replied on behalf of the British Dental Association. The Council having deliberated *in camera*, the PRESIDENT, on strangers being re-admitted announced the finding of the Council as follows : " Mr. W. Macgregor Veitch, and also Mr. Thos. Wafer Byrne—The Council have given long and careful consideration to your case and, on the facts found in the Report of the Dental Committee, it has been found that you have been guilty of conduct which is infamous or disgraceful in a professional respect, and the Council direct the Registrar to erase from the Dentists' Register the name of William MacGregor Veitch and the name of Thomas Wafer Byrne."

The Council next considered the Report of the Dental Committee on the inquiry held on May 19th, 1906, with regard to Isidore Clifford, Ruby Edmond Clifford, Walter Clifford and Stanley Clifford, all on the Dentists' Register as at 20, Grosvenor Street, London, W., and as in practice before July 22nd, 1878. The Committee

find that the following facts were established by the evidence :—

All the accused practitioners joined in forming and are the principal shareholders and the only directors of a limited company named " The American Dental Institute, Ltd.," incorporated under the Companies Acts for the purpose (*inter alia*) of promoting the adoption of advanced American and other scientific methods of dental surgery, which company carries on dental practice at divers addresses in London, Manchester, and Liverpool. That in such practice the company employs unregistered assistants (namely, Mr. Skrimshire, Mr. Robertson, Mr. McCormick, Mr. Kennedy, Mr. McDermid, and Mr. Storey, all using the title of doctor) to attend patients and perform dental operations upon them. That the company systematically advertises extensively by pamphlets of an objectionable character and containing claims of superiority over other practitioners and depreciation of them. The accused practitioners by their Counsel also did not dispute the accuracy of an article in the *Review of Reviews* which set out at great length within quotation marks an interview with one of the directors of the company, containing scandalous and highly objectionable remarks with regard to English dentists and dentistry. The accused practitioners by their Counsel undertook that the company (of which they are practically the whole of the shareholders) should be dissolved; that neither they nor the company would employ any persons contrary to the resolution of Council of November 24th, 1892, and further that they and the Company would discontinue all advertisements of every kind. The evidence before the Committee consisted of the following :—

(1) The oral evidence of the following persons :—(a) Mr. Charles Bowen, (b) Miss A. F. Foley, (c) Mr. W. Knight.

(2) The following depositions and statements :—(a) Statement submitted by the Hon. Sec. of the British Dental Association, with office copy of the memorandum of Association of the American Dental Institute, Limited, and of the annual returns of that Company, dated October 11th, 1905, and with three pamphlets circulated by that company, and a copy of the *Review of Reviews*, dated November 15th, 1901, containing an account of an interview with one of the directors of that company. (b) Two statutory declarations by Mr. Charles Bowen, dated respectively April 26th and May 4th, both in 1906, the latter exhibiting a pamphlet circulated by the American Dental Institute, Limited. (c) A statutory declaration by Miss A. F. Foley, dated April 27th, 1906, exhibiting a card of the American Dental Institute, Limited. (d) A statutory declaration by Mr. W. Knight, dated April 17th, 1906. (e) A statutory declaration by Mr. W. F. T. Brown, dated April 28th, 1906. (f) A statutory declaration by Mr. Arthur Cecil Curtis-Hayward, dated May 4th, 1906. (g) A letter from the American Dental Institute, Limited, to Mr. W. Knight, dated April 28th, 1906, with two appointment cards. (h) An account for professional attendance by the American Dental Institute, Limited, addressed to Mr. W. Knight, dated May 17th, 1906. (i) A letter from the Solicitor of the accused practitioners to the Registrar, dated May 4th, 1906.

All the accused practitioners were present in answer to their notices, together with Mr. C. M. Warrington, K.C., with him Mr. T. L. Wilkinson, their Counsel instructed by Messrs. Frank Richardson and Sadlers, Solicitors.

The British Dental Association, the Complainants, were represented by Mr. R. W. Turner, Counsel, instructed by Messrs. Bowman and Curtis-Hayward, Solicitors.

Mr. Warrington and Mr. Turner briefly addressed the Council. The Council having deliberated *in camera*, the PRESIDENT, on strangers being re-admitted, announced the decision of the Council as follows :— " Isidore Clifford, Ruby Edmond Clifford, Walter Clifford and Stanley Clifford—The Council have deliberated carefully on your case, and on the facts found in

the report of the Dental Committee, it has been proved that you have been guilty of conduct which is infamous and disgraceful in a professional respect, and the Council directs the Registrar to erase from the Dentists' Register the names of Isidore Clifford, Ruby Edmond Clifford, Walter Clifford and Stanley Clifford."

Moved by Dr. NORMAN MOORE, seconded by Sir VICTOR HORSLEY and carried unanimously: That the recommendation of the Executive Committee with reference to the British Optical Association and in regard to the Sight-testing Opticians Bill be adopted as follows: "That the Lord President of the Privy Council be informed that the Council have carefully considered the petition and the Bill submitted to them, and are of opinion that it would be dangerous in the public interest to confer the privileges and powers contemplated therein on persons other than those duly qualified in medicine and surgery; and that the Council trust that the sanction of Parliament and of the Privy Council will be withheld from these proposals."

Moved by Dr. PUE SMITH, seconded by Mr. MORRIS and agreed to: That the accompanying memorandum, subject to such amendments as may be approved, be transmitted to the Lord President of the Privy Council as setting forth the grounds on which the objections of the Council are based.

Moved by Dr. NORMAN MOORE, seconded by Sir THOMAS MYLES, and agreed to: That the following letter from the President of the Pharmaceutical Society be received and entered in the Minutes:—

" 26, Brechin Place, South Kensington.
May 22nd, 1906.

"Dear Dr. MacAlister,—I am writing as President of the Pharmaceutical Society of Great Britain, to draw the attention of the General Medical Council to the amendment which was recently carried in the House of Lords on the Poisons and Pharmacy Bill, to the effect that a company or body corporate, composed of unqualified persons, may use the title of chemist provided they employ a person who is qualified under the Pharmacy Acts.

"This decision, if allowed to become law, may have far-reaching results, not only to chemists, but also to dentists, medical men, and others where a personal qualification is required by law.

"I hope the General Medical Council may see fit to exert their great influence to protest against such a new departure, and I have the honour to invite that Council to take such steps as they deem necessary to impress upon the Government and the Houses of Parliament the danger to the public, and the injustice to qualified persons, of such proposed legislation.

"I am, yours very faithfully,

"R. A. ROBINSON,

"President of the Pharmaceutical Society of Great Britain.

"Dr. MacAlister, President,
"General Medical Council."

Moved by Mr. TOMES, seconded by Sir John William MOORE, and agreed to: That the President be requested to inform the Lord President of the Privy Council that, in the opinion of this Council, the principle involved in the Poisons and Pharmacy Bill, as amended in the House of Lords, whereby corporate bodies are permitted to assume professional titles, which titles no member or director of such company need be personally qualified by training, examination, and registration to assume, is fraught with obvious and extreme danger to the public."

Moved by Sir HUGH BEEVOR, seconded by Mr. MORRIS, and agreed to: That Mr. Edward Percy Paton, F.R.C.S. Eng., M.D. Univ. Lond., be appointed Assistant Examiner in Surgery to the Apothecaries' Society of London for a period of four years, vice Mr. Steward, who retires by rotation."

Moved by Dr. ADYER-CURRAN, seconded by Sir THOMAS MYLES: That in consideration of the heavy expense entailed on the Apothecaries Hall, Dublin, by the appointment of the Surgical Examiners from London and Edinburgh respectively, the Council resolve that at the next vacancy these examiners be

appointed from amongst the profession practising in Dublin.

After a short discussion Dr. ADYER-CURRAN, with the consent of his seconder and of the Council, subsequently withdrew his motion.

Moved by Sir PATRICK HERON WATSON, seconded by Dr. NORMAN MOORE, and agreed to: That the Report from the Examination-Committee on the returns as to examinations for entrance to the Navy, Army, and Indian Medical Services received by the General Council on May 22nd, 1906, be received and entered in the Minutes.

Moved by Mr. BROWN, seconded by Dr. BRUCE: That a copy of this Report be sent to each licensing body.

The motion was lost.

Moved by Sir THOMAS FRASER, seconded by Sir PATRICK HERON WATSON, and agreed to: That the President and Treasurers of the Council be requested to arrange for the preparation and transmission of a suitable address of congratulation to the University of Aberdeen on the celebration in September next of its four-hundredth anniversary."

By direction from the Chair, strangers then withdrew, in order that a certain matter might be considered.

The Council subsequently adjourned.

FOURTH DAY—FRIDAY, MAY 25TH, 1906.

Dr. MACALISTER, President, in the Chair.

The Minutes of the last meeting were read, and as amended, confirmed.

The Council in camera then considered a preliminary matter before proceeding with the programme of business.

On the re-admission of strangers the Council considered the case of Alexander Lane, registered as of Saville Chambers, Newcastle-on-Tyne, M.R.C.S. Eng. 1880, L.S.A. Lond. 1880, F.R.C.S.I. 1893, M.D. Dur. 1899, who had been summoned to appear before the Council to answer the following charge as formulated by the Council's solicitor: "That you sold to Mr. Ellis Pearson a medical practice at Bideford which was not a genuine *bona-fide* goodwill and practice, but was a practice fraudulently built up by you for the purpose of sale.

Dr. Lane attended in answer to his notice together with Mr. F. W. Hill, of 134, Fenchurch Street, E.C., his solicitor.

Dr. Bateman appeared on behalf of the Medical Defence Union, the complainants, together with Mr. Ellis Pearson.

The solicitor of the Council having read the notice, Dr. Bateman asked a preliminary question as to the manner in which the Council desired him to conduct the case, as he was prepared either to go into all the facts of the case, or to commence with the verdict of the jury in the action for damages. Mr. Hill also expressed his readiness to adopt either course, and stated that he was willing to take up the case without entering into it *ab initio*, provided that he might deal with the Judge's summing-up to the jury. On the advice of Mr. Lushington this was agreed to, and Dr. Bateman opened his case. He called Mr. Pearson as a witness and examined him as to the accuracy of his declaration and of the exhibits thereto. Mr. Pearson was then cross-examined by Mr. Hill, and re-examined by Dr. Bateman. This closed Dr. Bateman's case.

Mr. Hill then opened the case for Dr. Lane by tendering him as a witness for cross-examination by Dr. Bateman, and to answer any questions which the Council might desire to ask. He did not himself propose to ask any questions at this stage. Dr. Bateman accordingly cross-examined Dr. Lane. He was re-examined by Mr. Hill as to an offer of a composition which he had made to Mr. Pearson, and as to an application to a judge in Chambers about a month after the trial for a stay of execution, which had been refused on the ground that it was made too late.

Dr. Lane answered questions put to him by the legal assessor as to the steps which had been taken

by him or on his behalf to apply for a new trial and a stay of execution.

Mr. Hill tendered an official transcript of the shorthand writers' notes of the summing-up by Mr. Justice Lawrance at the trial of the action which he read a copy of the taxed bill of the plaintiff's costs to show the date when the application for a stay of execution had been refused; the Report by the Official Receiver; and the decision of the County Court Judge, which he put in and read.

Dr. Bateman did not take exception to any of these documents.

Mr. Hill also read the claim of the plaintiff in the action, and the judgment of Mr. Justice Bigham and Mr. Justice A. G. Lawrance on the appeal against the decision of the County Court Judge.

Mr. Hill then in a clever speech addressed the Council on behalf of Dr. Lane. Dr. Bateman addressed the Council in reply.

The Council deliberated on the case *in camera*. Strangers having been re-admitted, the President announced the decision of the Council as follows: "Dr. Alexander Lane.—The Council have deliberated on your case and have passed the following resolution: That the facts alleged against you in the Notice of Inquiry have not been proved to the satisfaction of the Council."

The Council proceeded to the consideration of the case of James Brander, registered as of 44, Leadside, Northfield, Aberdeen, M.B., Mast. Surg. 1876, Univ. Aberd., who had been summoned to appear before the Council on the following charge:—"That you were on the 15th day of February, 1906, convicted of the following crime or offence at Aberdeen Police Court namely, of drunkenness and riotous behaviour." Mr. Brander did not answer to his notice. The solicitor of the Council read the notice to attend, the answer by the accused practitioner, the certificate on conviction and notes of previous convictions which had been obtained from the Aberdeen police authorities. The Council deliberated *in camera* and, strangers having been re-admitted the President announced the decision of the Council as follows: "That James Brander having been proved to have been convicted of a crime or offence the Registrar be directed to erase his name from the Medical Register."

The Council then adjourned.

FIFTH DAY.—SATURDAY, MAY 26TH, 1906.

Dr. MACALISTER, President, in the Chair.

In answer to a question by Mr. Tomes (notice of which had been given) with regard to the communication to the Lord President of the Privy Council, on the Poisons and Pharmacy Bill, the President read the letter which he (the President) had sent which was entered on the minutes.

The Council then considered the case against Hamlet Lloyd Davies adjourned from November 30th, 1905. Mr. Davies appeared before the Council and stated that he had resigned the appointment to the Rusholme and District Provident Dispensary and said he was now assisting in a cash private practice. The solicitor of the Council read a letter from Dr. Bateman who had represented the complainants, the Medical Defence Union, in which he informed the Council that there was no further complaint.

The Council, having deliberated *in camera*, the President, on the re-admission of strangers, informed Mr. Davies that his name would not be erased from the Register.

The President announced that the name of William Patrick Kirwan would be restored to the Register.

The Council next received a report from the Examination Committee on the whole cycle of Visitations and Inspections. The report as proposed by Sir P. Heron Watson, seconded by Dr. Caton, was accepted to be placed on the minutes, after each clause had been separately discussed (proposer and seconder being the same). (Clauses 1, 2, 3, 4, 5 were carried after a little discussion; Clause 6 was carried after some discussion as to the position the subject of pathology should

occupy in the examinations, 7, 8, 9 were agreed to; 10 was carried—19 for, 12 against, 1 absent—after considerable discussion with regard to special subjects at examinations, and the advisability or not of the examiner in these subjects being an expert in them, several amendments being proposed and lost; 11, 12, 13, 14 were carried; an amendment of Sir Victor Horsley, seconded by Dr. Bruce, to the effect that the second paragraph should be omitted in Clause 15 was carried; 16 was approved, as also 17 with the addition of: "It is the opinion of the Examination Committee that no Candidate who has failed in Clinical Medicine or Clinical Surgery can pass his final examinations"; the other clauses of the Report were approved.

A motion was next brought forward by Dr. Bruce, seconded by Sir T. McC. Anderson and agreed to: That it be remitted to the Education Com. to consider how far Recommendation V. of the General Medical Council—viz., 'That the fifth year should be devoted to Clinical work at one or more public hospitals or dispensaries, British or Foreign, recognised by any of the medical authorities mentioned in Schedule A of the Medical Act, 1858, provided that of this year six months may be passed as a pupil to a Registered Practitioner possessing such opportunities of imparting practical knowledge, as shall be satisfactory to the Medical authorities'—is at present being given effect to, and if the Committee sees fit to recommend to the Council such changes in the said resolution as would be likely more effectually to secure the object aimed at by the Council in 1890." Dr. Bruce made a speech in support of his motion. Dr. Mackay, on the part of the Education committee, said that the Committee would be very glad to consider the question raised by the motion, but he thought it best that they should not be unduly hurried.

The Chairman of Business (Dr. Norman Moore) then moved that the nominations of the Branch Council for the following Committees be adopted—Examination Education, Public Health and also the names of members for the following Committees (nearly in every case the names being those of the present members). Pharmacopœia, Finance, Dental. These motions were each seconded and carried.

The Council then adjourned.

CORRESPONDENCE.

FROM OUR SPECIAL CORRESPONDENTS ABROAD.

FRANCE.

Paris, May 27th, 1906.

MEDICAL TREATMENT OF CANCER.

OF all the maladies which afflict humanity, cancer in its causes and treatment is perhaps the least understood, and the number of inoperable cases are legion. It is for this reason that any medical treatment promising the least success is always welcome. The general treatment of cancer is that which applies to all cachectic affections, while the local treatment is considerably varied in its applications. But any or all of the therapeutic agents employed give but little satisfaction both to the medical attendant and the patient. Dr. Le Toux, however, recommends strongly the injections of one or other of the usual serums around the malignant growth, and affirms that they retard considerably the progress of the tumour and raise the moral condition of the patient.

He employs indifferently anti-diphtheritic and anti-tetanic serum for no other reason than that they are easily obtainable. He injects around the cancer every eight days ten cubic centimetres (two drachms and a half) of serum. The needle is introduced into the healthy skin, the point directed towards the tumour which it touches, when the liquid is injected, the needle is withdrawn and another injection made farther on, so that finally the periphery of the tumour is thus bathed in serum. The usual effect of these injections is a decrease in the volume and a flattening of the

tumour; the fungosities assume a healthy aspect and the general condition of the patient is improved. In certain cases, like the following, both patient and attendant cherished for a time the illusion that an effective cure without operation had been obtained.

A woman, æt. 60, entered the hospital at Vannes in January, 1904, for an ulcerating tumour of the right breast. The patient, robust and mother of a large family, stated that two years previously she received a violent blow on the right breast, and suffered from it for about a month. Some time afterwards, she noticed a hard lump in the gland, but said nothing about it until the skin began to ulcerate.

When she entered the hospital her general condition was perfect, but the right mammary gland was very voluminous and largely ulcerated. An operation was proposed and accepted, and M. Le Toux removed the breast and all the glands he could find in the axilla. A month after, the patient left the hospital the wound being almost completely healed. Towards the end of the same year the patient returned to the hospital, but this time she presented a striking contrast to her condition some months before. She was emaciated, cachectic, and so weak that she almost fainted when being examined. When the breast was uncovered a large ulcerated and bleeding morbid growth was found seated on the cicatrix of the previous operation surrounded with violet coloured skin. An operation was impossible.

Injections of anti-diphtheritic serum were made every week for five weeks, as above described. After the first injections the hæmorrhage ceased and the tumour commenced to flatten. In the third week the decrease in the growth was remarkable, while the fungoid ulcerations changed aspect, resembling healthy granulations, and the patient was so surprised at the change that she went about telling everyone of her wonderful cure.

However, the progress was not maintained; the fifth series of injections remained without effect, on the contrary the tumour seemed to have a tendency to increase in size. A change in the serum was made, but the anti-tetanic serum was no better, and it was evident that it was useless to proceed any further with that treatment. As the condition of the patient had, however, greatly improved, Dr. Le Toux suggested a second operation which was now possible, but the patient feeling herself so much better refused absolutely all interference, and some months afterwards she succumbed.

Other cases observed and treated by the head-surgeon of the Vannes hospital warranted him to state that in the employ of these serums we have one of the best methods of treating inoperable cancers, and which may be prescribed concurrently with other means.

The treatment is easy and is worth a trial; it improves the local and general conditions of the patient and raises her hopes, to the moral and material benefit of the treating physicians.

GERMANY.

Berlin, May 27th, 1906.

At the German Surgical Society, Hr. Kraster, Freiburg i. B., spoke on

FURTHER DEVELOPMENT OF OPERATION FOR HIGH-SEATED CANCER OF THE RECTUM.

He would confine himself to the combined method as the only one that was in a position to improve results. The sacral operation was inadequate, as the lymph glands could not be extirpated by it. The idea of the combined method was not new, but it had only more recently become practicable. Laparotomy was added to the sacral incision, when one was placed in a difficult situation; it was an act of desperation during an operation. Such operations had been several times performed, but the results had been unfavourable.

That was not to be wondered at when laparotomy was a last resource and performed after lengthened futile attempts to get at the disease by the sacral opening. Later, however, the combined operation was decided on from the beginning, and then not only was the operation made easier, but other advantages were gained. The operation became more cleanly, it was easier to find out the extent of the disease, to recognise the glands implicated and to ascertain whether a successful operation was possible. In case it was not, the sacral opening would not be made and one would content oneself with making an artificial anus. The abdominal incision must be made in such a way as to allow thorough inspection of the pelvis. The Trendelenberg position was the best, the incision was that for artificial anus, or the median incision might be selected, or the two might be combined. In France an iliac anus was now made, and all was then extirpated through the sphincter. This method had not met with approval in Germany, and rightly so. The speaker was opposed to it, as continence and retention of the function of the bowel were better retained by the combined than by the sacral method, and for this reason resection of the rectum was thought better. This was specially recommended by Trendelenberg. The diseased part was made movable through the abdomen, brought up, and amputated. Unfortunately this could not often be done, the size of the tumour with the gland making it frequently impossible. In such cases therefore, the sacral incision must be brought into play. The speaker had first done this in 1899, and had frequently repeated it. The operation was done more easily when after opening the abdomen the bowel was cut through above with the thermocautery; the upper end was in charge of an assistant; the lower was invaginated and sutured. The tumour was now easily separated from the sacral side. The hæmorrhoidal vessels were ligatured, so that the operation was bloodless. Both hypogastric vessels might be ligatured at the same time, if necessary. After mobilisation of the tumour, the patient was placed on the side and the sacral opening was made. The extirpation of the tumour was now made from the abdomen. The operation was easier in women than in men. After resection the sacral wound was closed by suture, and the dressings applied.

What now was gained by the combined method? Was recovery more permanent? One could not say at present. Even the immediate results could not be estimated as no one surgeon had done it many times. We had, therefore, to collect the result of the different operators. Schloffer had done this: He had collected 65 cases, of which 33 were fatal. The speaker had performed the operation ten times with four deaths. The mortality was not very encouraging, but the operation might be much more perfect and in such cases where the patients were near to death already the results were not quite so "unerfreulich" The causes of death were of importance—2 patients died of collapse after tedious operation, and practice would remedy this. Most of the speaker's deaths were among his earlier cases. Shortening the period of narcosis would help, and perhaps we could do without general anaesthesia. One patient died from obstruction of the bowel from displacement of the omentum and torsion of the colon. A death from such a cause would not occur again, as he now fixed the omentum and prevented its slipping back. The operation was much less dangerous in females. Among the ten cases were three women, all these recovered. According to Schloffer of 13 men 8 died, but of 10 women only one succumbed. The reason for this lay in the greater resisting power of women, and also in their more roomy pelvis. He advised that we should not be so reluctant to employ the combined method, nor to use it only for the worst cases and as a last resource. We should then make use of its advantages; we should certainly obtain better permanent results, and by further improving the technique of the operation and by practice we should reduce the rate of mortality.

AUSTRIA.

Vienna, May 27, 1906.

PROTRACTED PRIAPISM.

At the Gesellschaft der Aerzte, Blum showed the members a young man, æt. 20, who, six days previously had been suddenly attacked during the night with a very painful erection which had existed ever since.

According to his own story, he fell from a ladder six months ago and alighted on the buttocks, injuring the perineum which was followed by inflammation in the neighbouring tissue. There are no signs or symptoms of sexual abuse or organic poisons. The penis was 21 cms. in length=8 inches, with a hard bony resistance which was confined to the corpus cavernosa penis leaving the corpus cavernosum urethrae quite free and flaccid at the base, the glans penis white, reaching to the umbilicus.

The cutaneous surface of the organ was quite unchanged; no testimony of self pollution or sexual excitement and no evidence of any nervine defect beyond the white pale face of the patient, who was evidently suffering from a severe condition of leucæmia linealis.

The patient had an enormously enlarged spleen, with great enlarged glands in the inguinal and axilla glands. The proportion of white to red corpuscles was 1.5 or 565,000 white corpuscles to 3,235,000 red.

Blum found other ten cases of this character recorded in the literature on the subject, which made it of some interest to the Society. There was one symptom in this case worthy of note, which does not appear in any of the other cases—viz., pain! In all the other cases this is specially noted; in the present case none is present to any extent—rather a discomfort.

Now as to the direct cause several suppositions have been offered. Among those given are thrombi, disturbance of the circulation in the corpora cavernosa, irritation of the nervi erigentes, swollen glands pressing on the nerves of the plexus pudendus, and the altered constituents of the leukæmic blood. In the case before us a slight thrombus may be present, as Kast found at the abduction on his case, when we remember the fall some time before.

The prognosis is dubious when we interpretate the dangers to which the patient is exposed during the morbid transitions. Purulent changes in the swollen member are prone to produce pyæmia. To avert this danger heroic surgical interference would be the best in the present case, but as we are uncertain of the real cause the Röntgen Rays have been adopted in the hope of producing resolution without the risk of pyæmia.

THE RONTGEN RAYS IN THE GRAVID STATE.

Fellner and Neumann next recorded the results of their experiments with 15 dogs. In three cases the rays were applied to the one ovary only; the other 12 both ovaries. The dogs were bound, narcotised with ether, and the rays applied at a focal distance of 12 cms. or 4.7 inches, giving six to seven Holzknechts units each. The first case had both ovaries acted on from the middle line, the later ones were acted on from the flanks whereby the uterus could be uncovered. Laparotomy was usually performed about the beginning of the third week and one of the ovaries removed. With only one exception none of the animals aborted. The oviducts about this time were observed to be degenerated while the primordial follicles were very few and also degenerated. The corpora lutea contained granular cells, which coloured feebly or not at all, and were void of a nucleus. They also contained a colloid mass, which did not lie in the centre, but was easily distinguished from the other part of the cell. The later oviducts were covered with a sort of granular epithelium and blood surrounded by a thickened fibrous tissue. The degeneration in these cells was more marked and indicated a more active secretion as in myoma approaching the climatic period. These results point to greater difficulty in proving criminal interference. In the discussion Latzo said he had often applied the rays in the gravid condition, but never produced abortion.

CORRESPONDENTS AT HOME.
SCOTLAND.

THE KINEMATOGRAPH AS A MEANS OF CLINICAL TEACHING.—A demonstration of the value of the kinematograph for teaching purposes was given before the Edinburgh Medico-Chirurgical Society, on May 16th, by Dr. W. Chase, of Boston, who has devoted much time and trouble to securing living pictures of eclamptic seizures, morbid gaits, spasms, chorea, and other disturbances of motion. Before exhibiting his films, the lecturer spoke of the educational value of the pictures, in enabling such phenomena as epileptic seizures to be studied at leisure. Many students, and even some practitioners, had never had an opportunity of seeing a typical major attack of epilepsy from start to finish, but when once satisfactory kinematographic films had been secured these could be multiplied and supplied to any teaching institution. The kinematograms exhibited by Dr. Chase were of great interest. He showed representations of patients in the *status epilepticus*, in which the various phases of the seizure were very clearly depicted. One of the points which came out especially clearly was the precise way in which (in some patients) each seizure recapitulated the movements of the one which preceded it. Again, the deep abdominal respiration characteristic of the later stages of the seizure, and the priapism which accompanies the tonic phase were well brought out. Various morbid gaits—ataxia, hemiplegia, festinating, spastic, &c.—were likewise well demonstrated. Of special interest were the pictures of idiots, showing the rhythmical salaam movements, gestures of the hands, &c., which are so common in some forms of mental defect. Athetosis forms the subject of another series of pictures, while cases of chorea, of habit spasm, of Jacksonian epilepsy were also shown. Dr. Chase repeated the demonstration on the succeeding day in the University for the benefit of the students, who attended to the number of nearly 600.

DISCIPLINE IN THE ROYAL INFIRMARY.—We have forbore to mention a matter affecting the relations of the resident physicians and surgeons of the Royal Infirmary to the governing body of that institution until a final decision was arrived at by the latter, and as the incident which became public property through the lay and professional press, is now at an end we need not refer to it at length. Some weeks ago a good deal of surprise was occasioned by the posting up at the gates of the Infirmary of a notice suspending the hospital tickets of five gentlemen who had formerly acted as resident physicians and surgeons. It was felt that although doubtless the managers might be justified in precluding, for disciplinary reasons, the holders of hospital tickets from entering the Infirmary, to pillory them by placing their names in what is practically a public place, was, to say the least, harsh. And additional doubt was cast on the justice of the action by the fact that several of the offenders were well known as excellent students and had a record which rendered rowdyism, or anything approaching thereto, improbable. It seems that these five gentlemen had been in the residency after the hours permitted by the rules, and that they were reported for this, and also for having made a noise in the corridors. While all admitted, and expressed regret for, their action in staying in the house after hours, those who were guiltless of the noise disclaimed blame therefor, while the guilty admitted their fault. Yet in spite of this the managers dealt with all on the same footing and punished them in the same way. The matter came up at several subsequent Board meetings and finally was disposed of by the managers, in consideration of a further apology and expression of regret, rescinding their sentence on all. The incident having terminated thus satisfactorily may well be forgotten.

EDINBURGH HARVEIAN FESTIVAL.—Sir John Halliday Croom delivered the oration at the 124th Harveian Festival held on May 18th. He selected as his topic

"The Times of Harvey." The oration was followed by the annual dinner, over which the orator presided, and at which the toast of "The immortal memory" was duly honoured. Dr. Edwin Bramwell proposed "The Guests," which was responded to by Dr. Chase, Boston.

CARSWELL-GILCHRIST FUND.—The fund which is being raised to assist in defraying the expense to which Drs. Carswell and Gilchrist were put in defending an action brought against them by a patient whom they had certified as insane will close on June 12th. Dr. W. G. Dun, 15, Royal Crescent, Glasgow, will receive subscriptions up to that date. The action was brought last December, and was commented on in this column at the time.

BELFAST.

THE HEALTH OF THE CITY.—Following up the campaign for the appointment of a thoroughly trained health officer for the city, a deputation of medical men from the Ulster Medical Society waited on the Public Health Committee of the Corporation last week, and laid their views on the situation clearly before them. The deputation consisted of Dr. Calwell (President of the Ulster Medical Society), Professors Lindsay and Byers, and Drs. Dempsey, Morrow, and Storey. Professors Lindsay and Byers spoke, pointing out the necessity of having a specially trained man as Medical Officer of Health, owing to the great advances recently made in that branch of medical work, and the impossibility of a general practitioner keeping abreast of them. They also pointed out that the great problems needing solution in Belfast were not peculiar to our city, but were found in most large cities, and a man trained in one of these was fitted to deal with the questions arising here. The Chairman of the Committee, Dr. King-Kerr, who has for weeks been carrying on a newspaper war with all reformers, tried to "corner" the members of the deputation by raising various difficulties concerning details, but they wisely answered that they were not there to settle details, but to urge certain broad general principles, and eventually the chairman was closed by some of his own committee, who gave a very sympathetic hearing to the deputation. It is reported that the Committee have agreed to recommend to the City Council that the salary offered to the new Medical Officer shall be £800 per annum to begin with, which is one of the main points contended for, as this will be sufficient to attract a properly qualified man. The other chief point is not yet settled, but there seems some chance of its being carried, and that is that an automatic rise of salary shall be arranged, so that the Health Officer will not be afraid to do his duty for fear of offending property owners who command the purse strings in the Council. At first sight it seems unlikely that the City fathers would abandon any of their jealously-guarded powers and prerogatives, but it seems that the canvassing and wire-pulling for rises of salary have in the past been such a nuisance that many of them would be glad to be rid of it by making all rises of salary automatic.

LETTERS TO THE EDITOR.

THE CHRISTIAN SCIENCE QUACK.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—At the present moment the public mind is being edified (no joke meant) by the prosecution of a medical man, or an ex-medical man, for healing a patient by the series of fantastic negations known as Christian Science. As that case is in the courts I have nothing to say as to its possible merits or demerits. I may however, draw attention to one extraordinary fact with regard to this form of irregular medical practice—namely, that the only attempt at punishment is concentrated upon one particular man, simply because he happens to have held—or to be still holding—a legal medical qualification. Surely if it be an offence for such a man to substitute deadly buffoonery in place of legitimate scientific method, it must be a far worse

offence for another person—with no pretence to any medical training whatever to tend the sick in the same way. Yet in our legislative wisdom we provide for the punishment of the qualified man and let the unqualified go scot free. Surely the protection of the community demands the control of all irregular medical practice, whether conducted by legally qualified or by ignorant and untrained charlatans. Where is the General Medical Council all this while? Why should their energies end at advising Parliament not to grant facilities for irregular medical practice to opticians and trading companies? Why should not the General Medical Council bring all its influence to bear upon the Government to pass a measure to control quacks and quackery? Such a measure is urgently needed for the safety of our fellow countrymen. Or why should not the General Medical Council stir up the police to take action? In many cases a police prosecution would put a stop to practices that are a standing disgrace to our boasted civilisation. It would take the boisterous satire of a Rabelais to do justice to the farce of a nation that rules the qualified medical man with a rod of iron, but lets the ignorant quack spread his nets for the unwary in the broad light of day. Meanwhile the pirate piles up hoards of ill-gotten pelf, while the highly qualified practitioner is often doomed to starve in silence.

I am, Sir, yours truly,

THE DENIZEN OF A BACK STREET.

THE ROYAL INSTITUTE OF PUBLIC HEALTH: THE HARBEN LECTURES.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—I shall be obliged if you will allow me to say that, owing to the great interest which has been evinced in the forthcoming Harben lectures, which are this year being delivered by Professor Elie Metchnikoff, of the Pasteur Institute, Paris, it has been found desirable to make arrangements for these lectures to be given in a larger lecture theatre than that of the institute.

Through the kindness of the Council of King's College the large lecture theatre of that college has been placed at the disposal of the institute, where the lectures will, therefore, be given on Friday, May 25th, Monday, May 28th, and Wednesday, May 30th, at 5 p.m.

A reception was held at the Royal Institute of Public Health, 37, Russell Square, on Friday, May 25th, at 3.30 p.m., at which Professor Metchnikoff was present, and to this, as well as to the lectures, all those interested were cordially invited.—I am, Sir, yours truly,

JAMES CANTLIE, M.A., M.B.Aberd.

London. W.

Honorary Secretary.

Trinity College Dublin—Post Graduate Classes.

We have received a copy of the prospectus of the post-graduate course of instruction in the School of Physic, Trinity College, Dublin. The classes begin on June 11th, and the course lasts three weeks. From the time-table we observe that work begins as a rule at 8.30 a.m., and the classes succeed one another at short intervals till 5 p.m. The scheme is a practical one and embraces hospital demonstrations, operations on the cadaver, laboratory work, and lectures on special subjects. A feature which, so far as we know, is peculiar to the postgraduate course in Trinity College, is that a limited number of the members of the class may reside in College rooms and dine on commons for a very moderate sum. As the number of available rooms is small, early application should be made by any qualified man who intends taking over the course and wishes to reside in college. The honorary secretary, 27, Lower Fitzwilliam Street, Dublin, will afford any further information that may be desired.

DR. TARNOWSKY, OF ST. PETERSBURG.

THE death is announced of Dr. Benjamin Tarnowsky, Honorary Professor of the Academy of Medicine, St. Petersburg, Member of the Council of Medicine of the Russian Empire. Deceased was well known to many members of the profession in this country.

MEDICAL NEWS IN BRIEF.

General Medical Council—Close of the Session.

THE last meeting of the present session took place on Monday, May 28th, 1906, Dr. MacAlister, President, in the chair.

Some very important medical business was dealt with, including among others a motion by Sir Hugh Beavor, with reference to an Act to vary the diploma or title of Licentiates of the Society of Apothecaries of London; an adjourned consideration postponed from December 1st, 1905, relating to the Visitation and Inspection of Qualifying Examinations; a motion by Sir V. Horsley, dealing with the voting in the election of Direct Representatives; and a motion by Mr. Brown for the increase in the number of Direct Representatives to the maximum number permitted by the Medical Act of 1880. A full report of this meeting will appear in our next issue.

The International Congress of Medicine.

A MEETING of the National Committee was held at the rooms of the Medical Society of London on Thursday last, May 24th. There were present, among others, Dr. Pavy, F.R.S., Sir Dyce Duckworth, Deputy Inspector General Johnston, R.N., Dr. Boyd Joll, Mr. George Jackson, Mr. Jessop, and the honorary secretaries (Mr. Clive Riviere and Mr. D'Arcy Power). A report upon the Lisbon Congress was read and adopted. It stated that about seventy-five members (British) had attended the Congress and that communications had been made to the Section by Dr. Pavy, Prof. Hubert Boyce, Prof. R. J. Anderson, Dr. Gustav Mann, Dr. Rashford, Sir Dyce Duckworth, Dr. Boyd, Joll, Dr. Mott, Dr. Ferrier, Dr. Radcliffe Crocker, Dr. Stanley P. Atkinson, Mr. D'Arcy Power and Mr. Kenneth Goadby. Attention was also drawn to the fact that by the appointment of Sir Dyce Duckworth by His Majesty's Honourable Privy Council, the British Government had been for the first time represented by a delegate. Votes of thanks were ordered to be given to Prof. Bombarda, the Secretary General of the Lisbon Congress, for the admirable manner in which he had organised the meeting, and to the British colony at Oporto for the hospitality which they had extended to the British members of the Congress who had visited that city. The proceedings closed with a vote of thanks to the Medical Society for the use of the room.

The Coleman Case. Meeting of the Medical Profession.

A NOTICE signed by the Presidents of the Royal Colleges of Physicians and Surgeons of Ireland has been sent to a large body of the medical profession in Ireland, asking them to attend a meeting which will be held at the Royal College of Physicians at 5 o'clock p.m., on Wednesday, June 6th. At this meeting the following resolution will be submitted:—"That we, the professional brethren of Dr. James Byrne Coleman, hereby congratulate him on the successful manner in which he has recently refuted the unfounded charges brought against him, and express our sympathy with him in the trouble through which he has passed 'without blemish on his character or honour.'" If this is carried, as there is no doubt it will be, it will be further proposed that a copy of it be sent to every member of the profession in Ireland for their approval, and that a special copy with the names of those approving of it be subsequently publicly presented to Dr. Coleman.

Royal College of Surgeons in Ireland.

FELLOWSHIP EXAMINATION.—The following candidates having passed the necessary examination have been admitted Fellows of the College:—C. M. Benson, B.Ch., &c., Univ. Dub.; P. J. Byrne, L.R.C.S., &c., Edin.; A. N. Crawford, L.R.C.S.I., &c.; P. L. Crossbie, L.R.C.S.I., &c., Surgeon Royal Navy; W. L. Murphy, L.R.C.S.I., &c.; W. J. Niblock, B.Ch., &c.; Royal Univ. Irel., Captain I.M.S.; G. Sheppard, L.R.C.S.I., R. A. Stoney, B.Ch., &c., Univ. Dub.

The following candidates have passed the primary part of the Fellowship Examinations: A. Greene, B.Ch., Univ. Dub.; R. V. Khedkar, L.R.C.S., &c., Edin.; J. W. Killen, B.Ch., &c., Royal Univ. Irel.; O. St. J. Gogarty, Student Univ. Dub.; J. P. Grainger, Student R.C.P. and S.I.; C. Greer, Student R.C.P. and S.I. (Victoria, Australia); W. E. Hopkins, Student Univ. Dub.; S. W. Hudson, Student R.C.P. and S.I.; H. B. Sherlock, Student R.C.P. and S.I.; G. J. W. Tierney, Student Royal Univ. Irel.; P. J. Timoney Student, R.C.P. and S.I.

Testimonial to Dr. Anthony Roche.

AN interesting ceremony took place recently at the Royal College of Science in Dublin, when Professor Anthony Roche was presented by upwards of 150 students, on the conclusion of his course of lectures on sanitary science, with a piece of plate. Mr. William Field, M.P., occupied the chair. The efforts which Professor Roche has made in the cause of popularising the study of sanitary science are well known.

London Hospital Medical College.

As Emeritus Professor of Clinical Surgery, Mr. Jonathan Hutchinson, F.R.S., will deliver a Course of four lectures on Tuesdays, June 12th, 19th, and 26th, and July 3rd, at 3 o'clock, in the Clinical Theatre at the Hospital, on the following subjects:—(1) June 12th—On the Transmission of Syphilis to the Third Generation. (2) June 19th—On Syphilis and Tuberculosis. (3) June 26th—On Tuberculosis and Diseases of the Skin. (4) July 3rd—On Diseases of the Skin caused by Insects. Members of the Profession will be admitted on presentation of their address cards.

Large Legacies by a Medical Man.

DR. THOMAS CORBETT, of Droitwich, formerly in practice as a surgeon at Kingston-on-Thames, has left property valued at £388,729 gross, including £48,314 in net personalty. In addition to his legacy of £10,000 to Worcester for pensions for the blind poor previously announced, he has bequeathed £5,000 each to the following London hospitals:—Guy's Hospital, St. George's Hospital, Middlesex Hospital, St. Thomas's Hospital, University College Hospital, Great Ormond Street Hospital for Sick Children, and the East London Hospital for Children. There are numerous other bequests to charities mentioned in the will, amounting altogether to over £96,000.

London School of Tropical Medicine.

AN "at home" at the Royal Albert Dock Branch of the Seamen's Hospital Society on Saturday, May 19th was attended by about 200 executive officers of all the London and many provincial hospitals. The occasion was the completion by Mr. P. Michelli, Secretary of the Seamen's Hospital Society, of his year of office as president of the Hospital Officers' Association, and among those present were:—Sir Francis Lovell, Sir Frederick Young, Captain Tunnard, Mr. Keith D. Young, the Society's architect, Mr. W. R. Pite (architect to the new King's College Hospital), Dr. Harford (of Livingstone College), Dr. C. C. Choyce (Medical Superintendent of the "Dreadnought" Hospital), Capt. Worlidge, Mr. Walter Alvey (honorary secretary Hospital Officers' Association), and Mr. Charles T. Walrond (consulting engineer St. George's Hospital and the Children's Hospital, Great Ormond Street), and many others. The Hospital and London School of Tropical Medicine in connection therewith were open to inspection, details of the building being given by Mr. Keith D. Young. A lantern demonstration was given in the theatre of the school and a demonstration of microscopic specimens of the parasites of malaria, sleeping sickness, &c., was given by Dr. Stanton in the laboratories. Speeches were delivered by Sir Fredk. Young and others, and opportunities were afforded for visiting vessels of the P. and O. and Ocean lines.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS. ENGLISH AND FOREIGN.

Specially Compiled for THE MEDICAL PRESS AND CIRCULAR.

RECENT SURGICAL LITERATURE.

The Diagnosis and Surgical Treatment of Gall-Stones.

—G. A. Syme (*Intercolonial Med. Journ.*, March 20), first calls attention to the diagnosis of gall-stones, the classical symptoms are usually given as severe pain, or colic, with vomiting, often rigors and fever, jaundice, and the passage of the stone in the motions. It is also stated that gall-stones may exist for a long time, without giving rise to symptoms of any sort; the results of operative treatment have, however, shown very clearly that gall-stones produce symptoms, though not the typical ones above mentioned, and hence are often overlooked. Among a large series of cases submitted to operation, half had never had biliary colic, and in half of those who had suffered from pain, it had been called gastralgia. Only 25 per cent. had been jaundiced, while the passage of a stone had hardly occurred in any of the cases. On the other hand, 80 per cent. complained of digestive disturbances, and in almost every case the earlier treatment had been for gastritis. It can be said with truth that the most common symptom of gall-stones is indigestion. The indigestion has, as its natural and expected sequence, an attack of nausea and vomiting, indeed gall-stones may give rise to all the symptoms of pyloric obstruction. Too great stress cannot be laid on the importance of early diagnosis of the presence of concretions in the gall bladder or ducts, also the error of regarding them as harmless because they do not produce any serious symptoms at the time, and the necessity for early operation as soon as their presence is suspected. G.

Metastases in Gonorrhœa.—W. Schwetz (*Revue Med. de la Suisse Romande, Jan.*), calls attention to the metastases which occur in addition to the local complication of gonorrhœa. The metastases may be divided into those in which the gonococcus may be demonstrated, and lesions of the skin and nervous system, the specific nature of which is clinically inferred. Of the first class, arthritis, bursitis, and teno-synovitis are the most common. Gonorrhœal endocarditis has often been observed, but nearly always in cases in which joints are already affected. Cases of pericarditis, pleurisy, phlebitis, and cerebro-spinal meningitis depending on the presence of the gonococcus, have been recorded. Gonorrhœal peritonitis should be classed rather as an extension of the infection than as a metastasis; less frequently the gonococcus can give rise to suppuration in the subcutaneous, or inter-muscular connective tissue. The coccus in all these cases is transported by the blood stream, and not as is sometimes supposed, by the lymphatics, the knee being so frequently infected is explained by the frequency with which this joint sustains slight injuries, which act as predisposing causes to the infection. As to the infections which are regarded on clinical grounds as complications of gonorrhœa, it is difficult to exclude the possibility of coincidence, or the presence of other causes. The eruptions are usually seen in cases with severe joint lesions, and may assume the form of erythema, purpura, or keratosis. While erythema may be attributed to the administration of copaiba, its occurrence when the drug is not taken, seems to imply a causal connection. Neuralgia in the form of sciatica, and peripheral neuritis may occur, optic neuritis is a very rare complication. In some cases atrophy of groups of muscles have been observed, without any implication of the corresponding joint. The cutaneous and nervous manifestations of gonorrhœa are due probably to toxins, which act in a manner analogous to those of diphtheria. G.

Scopolamine-Morphine — Chloroform Anæsthesia — H. J. Whitacre (*New York Med. Jour.*, March 31) gives

his views on this form of anæsthesia, the results were somewhat irregular, the application of the drug sometimes difficult, but in the great majority of the cases the patients enjoyed a freedom from the pre-operative and post-operative discomforts which was most gratifying. If the anæsthetic is safe there is abundant reason for its use in surgery, if the use of this drug is attended with danger, this should be made clear. With this object in view the author undertook a number of experiments on animals, combined with an extensive research of the literature on this subject; from this work he draws the following conclusions: (1) Scopolamine-morphine narcosis is not devoid of danger; (2) The use of scopolamine and morphine alone for surgical narcosis is not justifiable, and in his experience is not practicable; (3) a single dose two hours before operation, lessens the discomforts attendant upon the operative procedure to a high degree, and may obtain a definite place in surgical practice; (4) four deaths have occurred in a series of 2,400 cases, which have been so definitely related to the use of this method of narcosis, that they may be called scopolamine deaths. This, however, in the absence of autopsy demonstration; (5) these deaths have been reported as occurring with a type picture of alkaloid poisoning, and heart failure has been given as a direct cause of death; (6) a fatty degeneration of the liver and kidneys has been produced by repeated doses of scopolamine alone, and of scopolamine with morphine, in animals; (7) this method of producing or assisting narcosis cannot yet be recommended for use in general practice in spite of the great advantage it seems to offer; (8) scopolamine has a tendency to rapidly lose its power after it is placed in solution. A solution more than three days old should never be used. G.

Operation for the Radical Removal of Penile Carcinoma.—Nicoll (*Glasgow Medical Journal, May, 1906*), describes the method of operation he has employed for the last eleven years on epithelioma originating in the anterior part of the penis. In these cases the lymphatics pass almost wholly to the dorsum of the penis, the main vessels passing back on either side of the dorsal vein to the glands in the groin in the first instance, secondarily to the deep inguinal glands. The corpora cavernosa, the posterior parts of the corpus spongiosum, and the intra-pelvic glands are only affected secondarily and late in the process of the disease. A "Y" incision is employed. The "O" loop obliquely encircles the penis, and is merely skin deep. The "leg" of the Y extends along the dorsum of the penis. Through it the dorsal lymphatic glands are dissected out *en masse* with the dorsal bloodvessels, and all surrounding areolar fascia. The "arms" of the Y extend along the folds of the groins. They constitute deep wounds through which are removed all the superficial inguinal glands, and surrounding fat, and through which are also removed any deep inguinal glands found on exploration of the retro-peritoneal fat round the iliac vessels on the brim of the pelvis. The corpora cavernosa are divided transversely by transfixion, at the line of the skin incision round the penis. The corpus spongiosum is divided in a line somewhat anterior to the above and obliquely leaving the inferior lip of the divided urethra longer than the superior. When the wound is closed this ensures a meatal orifice with a "spout-like" inferior lip. Drainage is necessary, as one effect of the wholesale removal of fat and lymphatics from the groin is a lymphorrhœa from the groin wound. No catheter is

tied in, but regular catheterisation is practised for three or four days. The immediate results in the nine cases operated on by the author have all been satisfactory. Recurrence has not taken place in four patients (whose history was followed) after eight, six, five, and four years respectively. One early case died within eighteen months of extensive carcinomatous involvement of the deep inguinal glands. The seventh case died after three years with symptoms of hepatic cancer. The last two cases were operated on within the past year.

Extra-peritoneal Transplantation of the Ureters into the Rectum in Extroversion of the Bladder.

—London (*Brit. Med. Journ.*, April 28th, 1906) describes his method of operative treatment in extroversion of the bladder. The operation is commenced by completely dividing the artificial front wall of the bladder (if plastic operations have already been done) in order to expose the trigone. A director is passed up each ureter to serve as a guide. A button or rosette of mucous membrane, about the size of a sixpenny piece, is cut around the ureteral orifice, so as to save any valvular or sphincteric action which that opening might possess. By means of the director the termination of the ureter can be easily defined in the thickness of the bladder wall, followed and stripped up from the sub-peritoneal tissue. On passing the finger into the rectum, nothing more than its coats are found to intervene between it and another finger in the sub-peritoneal tissue. A pair of Lister's forceps are guided along the finger in the bowel and thrust through its walls; its blades are opened widely enough to seize the end of the ureter, which is then drawn through into the rectum, and kept there in position with an ordinary pair of clip forceps. The same manoeuvre is repeated on the opposite side, and the operation thus completed. The handles of the forceps dangle outside the anus. In the case of the operation particularly described the forceps attached to the right ureter were accidentally removed, and whilst the left ureter remained permanently transplanted, the right worked out of the rectum very soon. About a month later the right ureter was fixed into the sigmoid flexure, by a modification of Maydl's trans-peritoneal operation. The operation which was performed in 1899 is a complete success. The fears that used to be entertained as to the rectum being unable to tolerate the presence of urine are quite unfounded, as the patient who is now seventeen years old, can go all night without trouble. A modification of technique used by the author in subsequent operations consists in first inserting a rubber catheter with its point removed, into the ureter, and stitching it to the mucous membrane. This facilitates the drawing of the ureter into the rectum without so much bruising of the orifice.

Intubation of the Larynx in Cases of Diphtheritic Dyspnoea.—McCaul (*Dub. Journ. of Med. Science*) describes the technique of intubation of the larynx by O'Dwyer's tube, and discusses its advantages as compared with tracheotomy in hospital practice. His figures are taken from the cases treated in the Bristol Royal Infirmary during the last nine years. Out of the total of 300 serious cases on 36 tracheotomy alone was performed. Of these 25 or 69.4 per cent. died. In 85 equally severe cases intubation was followed by 15 deaths, or a mortality of 17.6 per cent. In addition, there were 40 cases in which it was necessary to do both tracheotomy and intubation. Of these 27, or 67.5 per cent. died. In 32 of these latter cases tracheotomy was necessary after intubation, owing to obstruction below the tube by membrane in the trachea. Blocking of the tube by membrane pushed down during introduction occurred in two cases, both of which were saved by prompt tracheotomy. In the author's opinion the advantages of intubation are—
1) Great diminution of mortality as compared with tracheotomy, especially in the first three years of life. (2) The absence of wound in the neck. (3) Celerity, the time usually required being 5—10 secs.,

after the gag has been inserted. (4) There is much less danger of subsequent pneumonia. (5) Intubation is easier to perform than tracheotomy. (6) In hospital practice intubation throws less work on the hospital staff.

Transient Blindness due to Spasms of the Retinal Artery.—R. A. Lundie (*Ophthal. Rev.*, May, 1906) records a case of transient blindness which he was able to watch with the ophthalmoscope. There was a short constriction of the vessel supplying the blind part of the retina which gave Lundie the impression of its being pinched between the thumb and forefinger. After administering a stimulant there was partial relaxation of the spasm. The patient recovered his sight within an hour from the onset. In discussing the subject the author says that spasm is the only explanation of the symptoms and appearances which seems feasible, since embolism or thrombus could hardly pass away as quickly as the symptoms do in many of these cases. Besides, the attacks are very liable to recur, and too often become permanent. Lundie is unable to explain the cause of the spasm. Many cases recorded as retinal embolism have been preceded by prodromal attacks of temporary loss of sight which may have been caused by spasm; the final attack differing from the others in its permanency. Spasm of the retinal arteries has an interest not confined to ophthalmology. If we have spasm occurring in arteries which are open to inspection is it not probable that we may have it elsewhere giving rise to symptoms not easily accounted for. In some of these cases of retinal spasm there is also found diplopia which can hardly be explained, except by an extension of the spasm beyond the retinal arteries to those of some part of the extra-ocular neuro-muscular apparatus. To arterial spasm may be credited, perhaps, some of the transient disturbances of the brain and other parts. While recording a condition which, although not a rarity, is seldom observed in operation, Dr. Lundy seems to avail himself of the opportunity of driving a nail into the coffin of retinal embolism.

Toxic Amblyopia.—Wray (*Trans. Ophthal. Society*, Vol. XXV., 1905), gives his views on this subject. Tachycardia may be found accompanied or unaccompanied by amblyopia in excessive smokers. In the cases of tachycardia from tobacco poisoning, there is no "toxic breath" as is always the case in amblyopia from the same poison. Pipe smokers and particularly those whose teeth are carious, furnish most of the cases of amblyopia. Cigarettes hardly ever cause this form of amblyopia. The giving up of tobacco does not always insure a complete cure, a positive scotoma in some cases persisting throughout life. The treatment Wray advises consists of abstinence from tobacco, drinking large quantities of water during the day—five pints—with moderate exercise and open-air life. In some cases he gives pot. iod. as a diuretic to avoid diarrhoea setting in. In 14 to 16 days he has seen vision improved from $\frac{1}{8}$ to $\frac{3}{8}$ in some cases.

Collargol Frictions in Panophthalmitis.—Baudoin (*La Clinique Ophthal.* 25 Juillet, 1905), relates having cured, or perhaps, aborted a case of panophthalmitis. At the first dressing after operation the wound was noticed to be badly infected. The treatment consisted of rubbing 20 per cent. collargol ointment for eight minutes into the skin of the inside of the arm which had first been thoroughly scrubbed to redness. The eye was treated with instillations of methylene blue and scopolamine and a dressing of 5 per cent. hermophenyl compress. Frictions were continued until the fifth day when the eye was out of danger. In a second case the infection was brought to a stand in eight days by this treatment.

NOTE.—A summary will appear each week in the following sequence:—(1) "*Recent Medical Literature.*" (2) "*Recent Surgical Literature.*" (3) "*Recent Gynaecological and Obstetrical Literature.*" (4) "*The Recent Literature of Physiology and Pathology.*"

NOTICES TO CORRESPONDENTS, &c.

Correspondents requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

ACCEPTED LECTURES AND ORIGINAL PAPERS.

The following have been received and are hereby acknowledged:—
Clinical Lecture "On Cough," by Arthur P. Beddard, M.D. Cantab., F.R.C.P. Lond., delivered at Guy's Hospital.

Clinical Lecture on "Inflammation of the Conjunctiva," by A. Maitland Ramsay, M.D., Professor of Ophthalmology at St. Mungo's College, Glasgow, delivered at the Glasgow Ophthalmic Institution.

Clinical Lecture on "The Clinical Examination of the Blood," by Arthur Whiting, M.D., M.R.C.P. Lond., delivered at the North London Post-Graduate College.

Clinical Lecture on "The Hæmoptysis of Tuberculous Subjects," by Professor G. Lemoine, M.D., of the Paris Faculty of Medicine.

Paper on "The Diagnosis of Some Acute Abdominal Diseases," by A. S. Barling, M.R.C.S., M.R.C.P. Lond., Surgeon to the Royal Lancaster Infirmary.

Paper on "The Treatment of Appendicitis," with cases (illustrated), by Dennis Kennedy, F.R.C.S., Surgeon to Jervis Street Hospital and to the Children's Hospital, Dublin.

Paper on "The Fulminating Form of Appendicitis and its Treatment," by H. J. Robson, M.R.C.S., M.R.C.P. Lond.

R. A. M. (Worcester).—The late Dr. Thos. Corbett, who has recently bequeathed the large legacies to hospitals, is not the gentleman of the same name familiarly known as "The Salt King." The latter died some years ago, leaving also a large fortune. Both were connected with Drogheda, and it is probable were related, but of this we have no knowledge.

NORTHUMBERLAND.—The terms offered do not appear to us to be adequate. On principle, therefore, our correspondent should decline to accept them.

MEDICAL EDUCATION.—Our correspondent's letter on this subject is unavoidably crowded out.

EXPERTS CREDO.—The preparation is no longer included in the "British Pharmacopœia."

STUDENT.—There is no objection, if it is a convenience, to paying the fees by instalments.

L.R.C.P. LOND.—The notice desiring the practitioner to cease attendance was quite in order, seeing that it was courteously expressed.

A HIGHLAND PRACTITIONER.—The relationship stated does not preclude a fee from being charged for services rendered.

G. E. S. (Manchester).—The next examination for commissions in the Indian Medical Service will be held in London on July 24th and four following days. Forms of application must be applied for previously at the India Office.

THE SEATING ACCOMMODATION AT THE ROYAL MEDICO-CHIRURGICAL SOCIETY.

We have received two letters from correspondents complaining of the hard wooden seats on which members are compelled to sit when attending any of the various Society meetings held within the Hanover Square building. One correspondent puts his protest in rhyme, the burden of which is summed up in the concluding lines:—

"It's no wonder at all the attendance is small,
For you might as well sit on the top of a wall."

After this lament we would suggest to the Council of the Society that members be induced to attend meetings in greater numbers by the promise of comfortable armchairs.

DR. JOHN DOCTOR YOUNG.

One of the witnesses in a case at the Blackpool County Court last week was Dr. Young, a local practitioner, and when he informed Judge Hamilton that his full name was John Doctor Young, his Honour remarked, with a smile, "That's curious. So you are Dr. John Doctor Young?"

Meetings of the Societies, Lectures, &c.

WEDNESDAY, MAY 30th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. J. Pardee: Clinique. (Surgical). 5.15 p.m. Lecture.—Dr. H. Tilley: Hoarseness—its Clinical Significance, Diagnosis, and Treatment.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. F. Taylor:—Medicine. 3.15 p.m. Mr. M. Robson: Surgery. 4 p.m. Mr. Cargill: Ophthalmology. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

THURSDAY, MAY 31st.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. Hutchinson: Clinique. (Surgical). 5.15 p.m. Lecture.—Mr. J. Sherren: Some Points in the Surgery of the Peripheral Nerves.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. G. Rankin: Medicine. 3.15 p.m. Sir W. Bennett: Surgery. 4 p.m. Mr. M. Davidson: Radiography. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Ear and Throat.

FRIDAY, JUNE 1st.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. L. Paton: Clinique. (Eye).

ASYLUM WORKERS' ASSOCIATION (11 Chandos Street, Cavendish Square, W.).—4 p.m. Annual General Meeting. Sir John Batty Tukey M.D., M.P., F.R.S.E., President of the Association, in the Chair.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. R. Bradford: Medicine.

3.15 p.m. Mr. McGavin: Surgery. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Skin.

SATURDAY, JUNE 2nd.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Out-patient Demonstration:—0 a.m. Surgical and Medical. 11 a.m. Eye.

Vacancies.

Cornwall County Asylum, Bodmin.—Third Assistant Medical Officer. Salary £135 per annum, with board, furnished apartments, washing, &c. Applications to the Medical Superintendent.

Huddersfield Infirmary.—Senior Male House Surgeon. Salary £80 per annum, with board, residence, and washing. Applications to Mr. J. Bate, Secretary, Infirmary, Huddersfield.

Bristol Royal Hospital for Sick Children and Women.—House Surgeon. Salary £80 per annum, with board, rooms, and attendance. Applications to the Secretary.

Devon County Asylum.—Assistant Medical Officer. Salary £125 per annum. All found. Applications to Medical Supt., County Asylum, Exminster.

North-Eastern Hospital for Children, Hackney Road, Bethnal Green, E.—Resident Medical Officer. Salary £100 per annum, with board, residence, and washing. Applications to the Secretary.

Northumberland House Private Asylum, Finsbury Park, N.—Assistant Medical Officer. Salary £120 per annum. Applications to the Medical Superintendent.

County Lunatic Asylum, Lancaster.—Assistant Medical Officer. Salary £150 per annum, with board, lodging, and washing. Applications to the Medical Superintendent.

Bethlem Hospital.—Two Resident House Physicians. Honorarium £25 each per quarter will be paid. Applications to the Treasurer, Bridewell Hospital, New Bridge Street, E.C. (See advt.)

Parish of Birmingham.—Workhouse Infirmary.—Assistant Resident Medical Officer.—Salary £104 per annum, with furnished apartments, rations, coal, gas, laundry, and attendance. Applications to Charles Fletcher, Clerk to the Guardians, Parish Offices, Edmund Street.

Appointments.

COOMBE, CAREY, M.D., B.S. Lond., Demonstrator of Pathology to University College, Bristol.

FRESHWATER, J. D. H., M.B. Cantab., House Physician at the Essex and Colchester Hospital.

GARDINER, PETER, M.D., C.M. Glasg., D.P.H. Lond., District Medical Officer by the Redruth (Cornwall) Board of Guardians.

HALL, ARTHUR, M.D. Cantab., Visiting Physician to the Sheffield Union Hospital.

HAYES, T. CRAWFORD, M.D. Dub., F.R.C.P. Lond., Professor Emeritus of King's College and Consulting Physician to the Hospital.

LYNCH, D. M.D., M.Ch. R.U.I., Certifying Surgeon under the Factory and Workshop Act for the Slieveveagh District of the county of Cork.

MARSHALL, J. A., M.D. Durh., House Surgeon at the Swanses Hospital.

STEEN, ROBERT HUNTER, M.D. Lond., Demonstrator in Psychological Medicine at King's College.

STRATFORD, HOWARD M., M.R.C.S., L.R.C.P. Lond., Surgeon at the Essex and Colchester Hospital.

TURLE, G. DE B., M.D., B.S. Durh., M.R.C.S. Eng., L.R.C.P. Lond., Obstetric Registrar and Tutor to King's College Hospital.

WILKINSON, GEORGE, M.B. Cantab., Visiting Surgeon to the Sheffield Union Hospital.

Births.

BEVAN.—On May 25th, at Kensington Garden Terrace, the wife of Arthur Bevan, M.D., of a daughter.

CROWE.—On May 22nd, at Homeleigh, Yelverton, the wife of H. Warren Crowe, M.D., of a daughter.

EMPSON.—On May 22nd, at Milborne Port, Somerset, the wife of John Empson, M.D., C.M., L.R.C.P.I., L.R.C.S.I., L.M., of a son.

FIELDING-GOULD.—On May 23rd, at 94 Mount Street, Grosvenor Square, London, the wife of R. Fielding-Gould, M.A., M.D., M.R.C.P., of a daughter.

MACNAMARA.—On May 17th, at Bankyle, Corodun, the wife of Dr. Geo. U. Macnamara, of a son.

PURDY.—On March 27th, at Port Said, J. S. Purdy, M.D., F.R.C.S., Surgeon-Captain New Zealand Militia, of a son.

WADDELOW.—On May 22nd, at the Chantry, Whiteley, the wife of John J. Waddelow, J.P., F.R.C.S. Eng., of a daughter.

Marriages.

CHRISTISON—FLOWER.—On May 24th, at St. Jude's, South Kensington, Fred Hamilton Christison, son of the late James Christison, M.D., of Preston, to Kathleen, daughter of the late Major Lamrock Flower, of Saltford, Somerset.

GRAY—FRAMPTON.—On May 23rd, at St. Alban's, Teddington, Ronald Evelyn Gordon Gray, M.A., M.B., B.C. Cantab., M.R.C.S., younger son of the late Archdeacon Gray, M.A., D.D. Cantab., and of Mrs. Gray, of Kensington, to Ethel, younger daughter of Algernon Frampton, of Teddington.

Deaths.

ASHMEAD.—On May 11th, at 850 West Twenty-third Street, New York, of tubercular meningitis, Sarah, wife of Albert S. Ashmead, M.D.

JACOB.—On May 25th, at Reigate, Edward Long Jacob, M.R.C.S., M.R.C.P., eldest son of the late Rev. George Andrew Jacob, D.D., aged 72.

MACCORMACK.—On May 24th, at 13 Malone Avenue, Belfast, John son of the late Henry MacCormack, M.D.

THE MEDICAL PRESS AND CIRCULAR.

No. 23.

NOTES AND COMMENTS.

Stamp-Lickers' Tongue.

SOME years ago we pointed out the dangers that lurk in the licked postage stamp, and coined the phrase "stamp-lickers' tongue" to describe an evil resulting therefrom. Since then much has happened—especially in the education of the Post-Office authorities, who now supply the public with "moisteners" at most of the large offices. Now it seems clear enough that any danger such as that pointed out must arise from the gummed side of the stamp. We stated that the risk was due to bacteria either native to or acquired by the sticky medium, which was in some instances stated to be made of horse-serum. We notice that our esteemed contemporary, the *Lancet*, has gone one better by detecting poison in the yellow threepenny stamp. It is not easy to understand how that section of the public which still adheres to the reckless practise of stamp-licking can be affected by the pigment used by the printer, unless, indeed, he takes to the expensive luxury of eating stamps. Poison, however, is a subtle thing, so it is perhaps well that the whole matter is being officially investigated. The poison in the case of the yellow stamp is said to be chromate of lead, and thereby hangs a tale of danger that is not phantom.

Lead in Pepper.

THE real and deadly peril to which we allude is not relegated to the picture side of a postage stamp, but is placed on our breakfast and dinner tables, and actually swallowed. There is strong reason to believe that chromate of lead is systematically used for the adulteration of yellow and red pepper. Several years ago a partner in some large lead works told the present writer of an extensive order for chromate of lead which was openly purchased for the purpose of adulterating pepper. Clearly, there could hardly be a more insidious or more deadly way of slowly poisoning that part of the community which seasons its food with the condiments of Cayenne or of Nepaul. For various reasons the examination of specimens of those two peppers by public health authorities is a rare occurrence, but the facts as stated are perfectly well known to every public analyst of experience. Both the peppers in question are so highly priced that adulteration becomes a game yielding large profits. Here is a simple lead adulteration that would reward official investigation with more sensational and useful "copy" than the consider-

ation of poisons that may or may not enter fractionally into the printers' ink of coloured stamps.

The L.S.A. (London) Diploma.

The General Medical Council has approved the principle of the proposed Act to vary the diploma laid before them by the London Society of Apothecaries. The draft Bill provides that the holder of the diploma shall be entitled to registration as a "Licentiate in Medicine and Surgery of the Society of Apothecaries, London." The letters to indicate so cumbersome a title will be multiple indeed, and it seems a great pity should the Apothecaries be unable to hit upon a terse description connecting the possession of both medical and surgical qualifications by its licentiates. The change in the description of the licentiateship has been inevitable ever since the Apothecaries took to medical and surgical practice. For generations the dispute as to the precise definition of the L.S.A. has been carried on with more or less acute remissions. Should the qualification become really popular under its new guise, it will prove a formidable rival to the Scotch and Irish Colleges. After all, it is only natural that Englishmen should prefer to have a London qualification, provided it can be obtained on equal terms and carries a status equal to that of minor provincial qualifying bodies.

Teaching of Midwifery.

The report of the special committee of the General Medical Council appointed to inquire into the operation of the rules regarding the midwifery practice of candidates for medical qualifications came under the consideration of the Council at its last meeting. It is a document of far-reaching importance, and, if acted upon, would, we believe, lead to a complete and long needed reform in midwifery teaching. The main trend of the committee's recommendations are in the direction of ensuring that students shall conduct twenty cases of labour in the intern or extern maternity department of a hospital after, and not until after, he has received sufficient preliminary instruction to enable him to profit by his bed-side experiences. Everyone who has any knowledge of the manner in which students are allowed to attend their cases in many institutions will understand at once how important such a change will be. It means two things, first, that the student will receive his instruction from persons competent to instruct him, and, secondly, that he

will receive it at a time when he is capable of mentally benefitting by it.

The Royal Commission on Trinity College, Dublin.

The eagerly awaited list of the members of the Royal Commission on Trinity College, Dublin, and the terms of reference have at last been published, and on the whole will, we believe, be found to give satisfaction both inside and outside the walls of that ancient seat of learning. In order that the Commission may get with as little delay as possible to the essential part of its labours, the report of the previous Commission on Higher Education in Ireland which sat in 1901 will be taken as read, and the labours of that Commission be considered as introductory to those of the present Commission. It is hoped that by this means a considerable amount of time will be saved.

Small-pox and Notification.

Under the familiar heading "How Disease is Spread," an account is published in a Manchester evening newspaper of a singularly gross and callous offence against the Notification Acts. In the police court it was stated that a Town Council official visited defendant's house and found that the whole of the family had suffered from small-pox. The mother and one of the boys were actually suffering from the malady at the time of his visit, but the boy continued at work. A girl attended school all the time. It was shown in evidence that the mother went to a public house to purchase beer, and that a man next door contracted the disease. The defence was that a month before a medical man said one of the children had chicken pox and the parents thought the rest were similarly affected. In a case of this kind it is clearly impossible to ascertain the extent of the resulting mischief. For weeks past an epidemic of small-pox has swept through the district, a fact that the existence of a single undetected and circulating focus of infection such as that of the family in question would quite account for. The loss in sickness and death arising therefrom would most likely reach in the aggregate a very large sum. The magistrates inflicted a fine of 5s. 6d. upon the parents for each of the two children exposed.

LEADING ARTICLE.

HOSPITAL ISOLATION AND SCARLET FEVER.

IN the autumn of 1904 we published a series of papers by different writers on the subject of scarlet fever and its preventive treatment by means of isolation hospitals. All these writers took the view, in which we ourselves concurred, that scarlet fever had shown itself refractory to hospital treatment, and that there were other objections to the method which were sufficiently grave to call for a full and authoritative inquiry. At that time, our voice was as one crying in the wilderness, but since then we have noted signs that the demand has had the sympathy not only of our contemporaries, but also of many prominent sanitarians, lay and medical. No doubt it needs a little boldness on the part of those who have advocated the erection of hospitals for scarlet

fever, to admit now that the system has proved far less successful than was anticipated, and, indeed, promised, but if as has been shown there are many serious drawbacks to the hospital system, it is wise and necessary that the whole question should be considered *de novo*. It cannot be contended that isolation hospitals are not in many ways a convenience to the medical officer of health and to the poor, but there are also specific dangers in them, and after all they were established not for the purposes of charitable relief but for the prevention of the spread of scarlet fever. It is now not in doubt that the hospitals have conspicuously failed to fulfil their primary object, and one can hardly wonder if grumbles and rumours of grumbles are heard in various quarters as to this result. Several medical officers of health have been led to make inquiries in their own districts as to the effect that has been produced in them by the establishment of hospitals, and though some of these investigations have furnished some evidence more or less favourable to the system, none of it has been really definite or conclusive. On the other hand, others have been equally astonished to find how little preventive work their hospitals have done. Dr. Thresh, Medical Officer of Health for Essex, speaking at a meeting of the Chelmsford Rural District Council the other day, said that his faith in the utility of infectious hospitals had been shaken in 1902, and from his own inquiries and reports received from other districts he had been bound to modify his views. In his annual report he stated that as a result of his study of the scarlet fever cases in his district, that where patients were removed from houses in which there were susceptible inmates practically as many secondary cases occurred in these houses as in those from which the patients were not removed. The cause of the failure of hospitals, he said, was so patent that one could only wonder it had not been recognised before, namely, there were so many patients suffering from mild attacks of scarlet fever and diphtheria, and so many healthy persons with the organism of these diseases in their throats, that spread took place far and wide from these unrecognised sources. This being so, it was obvious that no improvement in hospital administration or methods of treatment could have any effect in controlling the dissemination of these diseases. Dr. Thresh further made the significant statement that from his experience he could say that the majority of cases, if they could have reasonable care and attention, did better at home than in hospitals, where mild and severe cases, and acute and convalescent ones, were mixed indiscriminately in wards. He held that the provision of hospital facilities was a question for every district, and should be decided on the special circumstances presented by each district. We need hardly point out that words to this effect coming from so high an authority as Dr. Thresh, are worthy of peculiar respect and attention, and thus confirms amply the contentions raised in THE MEDICAL PRESS AND CIRCULAR nearly two

years ago. Moreover, other medical officers of experience, notably Dr. Arnold Evans, of Bradford, have written and spoken in a similar strain. Indeed, there are signs that the arguments used have at last filtered through to the medical department of the Local Government Board, for we hear that that Board are thinking of appointing a Commission to inquire into the working of the hospital system. We hope this is so, and we also hope that the Commission will be composed of members perfectly independent of Government influences, for it must be remembered that the Local Government Board itself has for twenty years been deeply committed to the system and has urged the indiscriminate provision of isolation hospitals on local authorities all through the country. The Commission should be free to express whatever views it forms precisely from the evidence tendered to it, that is, if its conclusions are to command general respect.

NOTES ON CURRENT TOPICS.

Clairvoyance and the Studio Murder.

It is hardly possible to imagine the daily press as a whole taking a less dignified attitude than that it has adopted towards what is called the "studio" murder. A sordid tragedy which must have caused ineffable pain to the relatives of the dead artist, and which might have well been left in the hands of the detective department, has been boomed for "copy" by many of the most popular journals as though it were a horse race or a cricket match. The psychological condition of a public which demands such detail in its horrors and of a press which retails them with ill-concealed gusto cannot but be a cause for anxiety to those who care for the sanity of their generation. By way of introducing an extra sensation into its columns the *Tribune* lately published a "dramatic statement" by a clairvoyante, in which this anonymous person sought to give a connected story of the crime. The clairvoyante is said to have been led to the work by a physician for whom and with whom she works, and this physician gave his time without "any pecuniary return or recompense of any nature." We think he might have been better employed. The whole of the visions seen by the clairvoyante are palpably reproductions of an early theory of the crime, backed up by some equivocal detail which can be made to mean anything or nothing. The only value attached to the statement is that it pins the clairvoyante to certain definite facts, which are now known almost certainly to be untrue, and in the event of an arrest being made they will be shown to be so. We would like to call attention to this "dramatic statement" merely for the purpose of fixing beforehand a tissue of "facts" which are already becoming attenuate as fresh evidence accumulates, and are likely to fade altogether when the full light of day is turned on. We fancy that this column of sensations will demonstrate pretty well what clairvoyance is worth.

The London & Counties Protection Society. THE recently issued annual report of the London & Counties Medical Protection Society is an interest-

ing document. It registers the combined progress of an excellent movement, and shows once again that medical men are by nature fitted for organisation. During the year 1905 no less than 446 new members were elected, and the total membership at the end of the year reached the encouraging figure of 3,552. At the same time the total income amounted to £2,069, 18s. as compared with £1,669 2s. 11d. in the previous year. But perhaps the most important financial fact in connection with this Society is that the reserve fund stands at £2,164 18s. 9d., and the total cash assets at £2,467 4s. 3d. Turning to the body of the report we find numberless instances in which members have been defended and aided in time of difficulty. The Society has also taken up the question of coroner's inquests in general, and Mr. Troutbeck's attitude in particular. While the Society must be congratulated upon their prosperity, it still remains a matter of unceasing regret that they cannot join forces with other organisations of a similar nature. It is the clear and bounden duty of every practitioner to join a body of this kind.

Bar v. Medicine.

A PLEASANT little function took place the other day at Northwood, in the shape of a golf-match between a team of barristers selected from the Bar Golfing Society and a team of doctors led by Dr. Girdlestone. Dr. Girdlestone beat his opponent Mr. Beveridge by the handsome margin of 5 up and 4 to play, and Dr. Simson, Dr. Howarth, and Dr. Dane gained almost equally easy victories over Mr. Simpson, Mr. Hoare, and Mr. Marshall Hall. Two of the matches were halved, and in one only—namely, that between Mr. F. S. Jackson and Dr. Webb, was the barrister successful, and then only on the home green. In a foursome which followed the doctors, represented by Dr. Girdlestone and Dr. Hawkins, did not do so well. They were actually 5 down at the eighth hole, but playing pluckily drew up level at the fifteenth; they lost the next two, however, and Mr. Beveridge and Mr. Bonner, their opponents, thus won by 2 up and 1 to play. We are glad to be able to congratulate the doctors on the prowess they exhibited and the success that attended their efforts, especially as the team consisted of working members who cannot find much time to improve their game. Social contests such as these conducted in a sportsmanlike spirit can do much good in helping medical men and barristers, whose professional interests are so widely separated in many ways, to understand and appreciate each other, and we hope to see many more of them organised and kept up.

French "Maybrick" Case.

FRANCE, that home of wonderful trials, has just emerged from a sensation that vividly recalls our own Maybrick case. A Mdme. Canaby was tried at Bordeaux for having attempted to poison her husband in order to be free to marry a friend who had known her for years, M. Rabot by name. On the facts that were proved there can be no

doubt that M. Canaby was taken ill at his house with arsenic poisoning and that he did not get better of it till he was removed to a nursing home and placed under skilled care. Also that the arsenic was obtained by Mdme. Canaby by means of prescriptions which she forged herself, and that she was in the habit of receiving money from M. Rabot. The extraordinary feature of the case was that M. Canaby declared that he believed in his wife's innocence and declined to take legal proceedings on his initiative. As is usual with female prisoners in France, Mdme. Canaby exhibited a series of neurotic phenomena in the dock and excited the greatest commiseration in the breasts of the public. The jury found her "not guilty" on the charge of attempted murder, but "guilty" of using forged documents, for which latter offence she was sentenced to fifteen months imprisonment. As, however, she had been nearly that time awaiting trial her sentence expires almost immediately. In the absence of full details we do not presume to express our own opinion on the facts, but surely this case, with the evidence so black against the prisoner and a verdict of "Not guilty," will find its way into the text-books of forensic medicine to show either the untrustworthiness of circumstantial evidence or the susceptibilities of French juries.]

Embalmed Beef.

FRESH meat the housewife can form some idea of; tinned meat can be guessed at; but sausages must be taken on trust. The energetic action which President Roosevelt is taking in passing a stringent bill for meat inspection through the American Parliament cannot but give rise to uneasy feelings in this country as to the trustworthiness of the preserved meats that come to us from the States. A novel written by Mr. Upton Sinclair called "The Jungle" caused a great deal of feeling in America. It dwelt in lurid terms on the ingenuity with which unsound meat and the flesh of diseased animals was so prepared for canning, hampickling, and sausage-making that the consumer could not recognise the defects. For ourselves we are inclined to think the book over-reaches itself, as it paints the horrors too thickly and with too warm a brush, but even if a tithe of the tricks adopted by the packers, and winked at by Government inspectors, are founded on fact, it would be well to draw on other sources for our supplies here. President Roosevelt's action, though it will doubtless tend to establish confidence in the trade eventually, is certainly disconcerting to the British consumer at the moment, and the trade would certainly do well in their own interest to take some steps to let the public over here know the full truth about these matters from their own point of view.

Geneva Convention.

JUST as one can kill a cat with a hatchet or by choking it with cream, so can war, that ghastly anachronism which civilised countries still tolerate, be killed either by emphasising its brutalities till people's consciences rebel or else by softening its

rigours till it becomes a farce. The first step in the latter direction was taken in 1864 by the holding of the first Geneva Conference, which it is well to remember was brought about largely through the efforts of a medical man, Dr. Dumant. The second Convention, held four years later, still farther defined the usages which should exist between civilised combatants in warfare; and now the Swiss Government are seeking to extend the principles on which the former Conventions were founded by a further gathering of international representatives. Most of the points for consideration are unfortunately minor ones of convenience, such as the provision of identification plates for soldiers, the prevention of robbery of the wounded, the interchange of casualty lists between combatants, the guarding of the wounded as prisoners of war, and the drawing up of fresh regulations for the hospital corps. Important doubtless as these points are, and much as all humanely disposed people will wish to have them settled, what would be really useful would be if they could be made the basis of a definite policy having for its object the reduction of war to absurdity. It is so illogical already that a soldier should be allowed to bayonet his opponent once, but not to repeat the act if the first blow takes effect, that a very little common-sense is needed to make the whole business of war a byword.

American Preserved Meats.

THE horrors of the American meat trade recently unearthed by that most masterful of men, Mr. Roosevelt, will affect many countries outside the U.S.A. The United Kingdom, for instance, is one of its big customers, but the trade will now most certainly show a rapid fall. There is nothing that impresses the imagination of the man in the street instantaneously and more deeply than anything to do with the purity and the cleanliness of his food. It will take many a day to forget that American potted meats, including game and chicken, are made of worthless odds and ends, often putrid, sometimes rejected and returned from a foreign port, fouled with the excreta of rats, stored in dark and noisome vaults, and ground up incontinently with poisoned rats. As table delicacies of the potted meat variety are not cooked, it seems tolerably certain that many disease organisms must in that way be conveyed to consumers. It is a revolting idea that Englishmen should be riddled with disease due to the cynical filthiness of American meat magnates. As heat destroys microbes some degree of safety may be induced by the thorough cooking of American preserved meats. There is much to be done, none the less, in setting the British house in order. The environment of many bakeries, hotels, and restaurant kitchens, private slaughter houses, sausage factories and other places where food is prepared and stored, is unspeakably unclean on our own side of [the Atlantic. "Preserve us from all preserved meats," would appear the safest maxim under present conditions.

Cotton Wool and Swallowed Foreign Bodies.

THE introduction of radiography has given the surgeon a fresh impetus in the treatment of foreign bodies in the alimentary canal. The use of œsophageal bougies before a screen examination would be nowadays bad surgery except in remote places or in cases of extreme urgency. A recently reported instance of disaster following the attempted instrumental dislodgment of a fragment of mutton-bone in the gullet recalls the cotton wool treatment of such cases introduced about a year ago by Bell, of Liverpool. His plan was simple. He gave the patient a small handful of absorbent cotton wool to eat mixed in gruel or in jam sandwiches. In several cases thus treated the foreign body was passed within twenty-four hours; enveloped in the cotton. The simplicity and safety of this plan should render it a valuable "stand-by" in general practice.

The Humanity of Surgery.

THE most popular view of the surgeon to the vulgar mind is that of a man callous to all the gentler feelings of mankind. Knife in hand he is ready to lay bare the innermost recesses of his fellow creatures, bodies at a moment's notice. Yet in truth his proceedings are all prompted by the highest motives that can animate the human heart—and as a matter of simple statement an immense amount of the good he effects is brought about without the use of a knife. The supreme guiding aim of the good surgeon is to safeguard the welfare of his patient, so far as may be possible to his art. To that end he subordinates all minor considerations, conscious of the fact that his surgery is founded on a real humanity that does not shrink from performing operations for want of resolution. If the body of a lower animal is needed to test some operative procedure or help his patient he exercises his power over that animal in the interests of the human being whose welfare is the paramount consideration. Yet there are shoals of sentimental folk ready to shriek at him as a heartless vivisector, whereas they would willingly sacrifice scores of fish, fowl, and higher mammals simply to feed their sick friend. But the surgeon goes his own way in spite of sentimentalities.

Income-Tax for Medical Men.

THERE are many arguments in favour of exempting incomes earned by professional men from taxation. If the principle is to be applied at all, it would be hard to imagine any single profession entitled to such exemption more than that of medicine. Its members have to work early and late and no large income is attainable without years of arduous application. The greater the success, again, the greater the need of individual exertion, and the fee remains a purely personal honorarium for services rendered until the last day of life. This standpoint is perhaps not sufficiently recognised by all authorities on political economy. Mr. Chiozza Money, for instance, recently remarked that professional incomes are often derived from

services which are of no value to the community. "The existence of a large leisured class," he goes on, "creates an army of attendants who draw big fees, but who most certainly do not earn them. Take the case of a fashionable barrister, who draws hundreds of pounds in connection with a society libel case, or that of a fashionable surgeon, who wastes his time dancing attendance upon well-to-do vermiform appendices, or that of a journalist hot-foot after a scandal." The barristers and journalists may safely be left to defend themselves. With regard to the "fashionable" disease, appendicitis, it may be pointed out that the malady like daylight falls on rich and poor without distinction. Even a great statistician, were he seized by this fatal bowel inflammation, might well expend a hundred pounds or so to secure the attendance, dancing or driving, or even deviling, of a skilled surgeon, otherwise the science of political economy and the House of Commons would probably lose a distinguished ornament. We take it that Mr. Money, like many economists, has sharp limitations in his knowledge of many social conditions, and that the medical world falls in one of the gaps. Under the circumstances, we may congratulate ourselves that the taxation or otherwise of professional incomes will not be settled by Mr. Chiozza Money.

PERSONAL.

LORD AMPHILL will preside at the annual meeting of the Colonial Nursing Association on June 13th, at 3.30 p.m., at the Colonial Office.

MR. WILLIAM EDWIN WILLIAMS, F.R.C.S.Ed., M.R.C.S.Eng., has been elected Chairman of the Bedwelty Division of Monmouthshire, in place of the late Mr. J. D. James, M.R.C.S.Eng.

MR. WILLIAM E. COLLINS, M.D.Lond., it is reported, will shortly be called to the Upper House in the New Zealand Legislature.

THE will of Mr. W. R. H. Stewart, F.R.C.S., late of 42, Devonshire Street, Portland Place, W., and of Wilbet Crofton, Orpington, Kent, a leading authority on diseases of the throat, nose and ear, has been proved at £12,347.

THE will of Dr. John Hamilton Buchanan, M.D., late of Sowerby, Thirsk, Yorks, fellow, ex-president of the Yorkshire branch of the Incorporated Society of Medical Officers of Health, J.P. for the North Riding of Yorks, medical officer of health to the Thirsk Union, has been proved at £12,832.

PROF. METCHNIKOFF, of Paris, who has been delivering the Harben lectures at King's College, is to be awarded the Harben gold medal by the Institute of Public Health, in recognition of his distinguished services to science.

ON Tuesday evening last a large party presented Dr. Anderson, of Ardsheal, with a handsome silver salver on the occasion of his leaving the district, in recognition of his many valuable services in his private and public capacity.

ON June 11th, Sir Donald Currie will lay the foundation stone of the new block of buildings, which is to be added to University College Hospital, London. The extension will include a school for advanced medical studies, a nurses' home, and a maternity students' home.

A CLINICAL LECTURE ON COUGH.

By ARTHUR F. BEDDARD, M.D. Cantab., F.R.C.P.Lond.,

Physician to West London Hospital; Assistant-Physician to Guy's Hospital, London.

GENTLEMEN,—I am going to say a few words about cough. It is a mistake to conclude that some affection of the respiratory tract is the only common cause of cough. That is, doubtless, a common cause, but by no means the only common cause. One difficulty often met with is this—that in many cases of slight bronchitis, on examining the chest, you hear nothing abnormal whatever. In other words, in order to make a diagnosis of slight bronchitis, which in these cases is the cause of cough, you have certainly got to exclude some other things. It is just the same with some people you meet with in the out-patient department who are wearing a plaster over their lower ribs. They have had pain on respiration, you have not heard any rub, but these patients are said to be suffering from pleurisy, this view being founded on the assumption that the commonest pain in the lower part of the ribs is that of pleurisy, instead of being, as it is, that of indigestion. The fact is, there are a large number of symptoms complained of by patients, and the only way in which you can diagnose their cause is by going for what is the commonest thing, and that is a question of experience to find out.

The commonest causes of cough are certain conditions of the pharynx, and then bronchitis, and until you have excluded certain conditions of the pharynx, it is impossible to say to a patient, "You are certainly suffering from bronchitis." Any affection of the respiratory tract may produce cough. You may have cough in pleurisy, or in enlarged glands of the neck, or as the result of things in the external auditory meatus, or in heart disease, or in œdema of the lungs, but nearly all these rarer conditions are early diagnosable by physical signs, and by things obviously existing in each respective case.

What are the conditions in the pharynx that you look for, in order to account for these frequent coughs? The commonest condition certainly is this: When you look down these people's throats you see an extremely red, rather purple, and œdematous-looking pharynx, and a great, long uvula. In many cases you see large venules all over the wall of the pharynx, on the flap of the palate, and also on the uvula itself. The commonest cause of this condition is certainly chronic indigestion, and, in saying that, I am giving you my own personal experience. Some people have the idea that stomach coughs are due to irritation of the vagus in the stomach. I do not believe it, because lots of people have plenty of gastric irritation, but they do not cough, as a rule, unless they have got this condition of their pharynx that I have described. Cough, associated with the external auditory meatus, is said to be due to irritation and consequent stimulation of the vagus nerve there. That may, or may not be true.

In other cases, when you look at the throats of people troubled with coughs, you see something different, especially on the back wall of their pharynx. This is covered by a red, granular, or chronic pharyngitic secretion, which is mucous or muco-purulent in character. That is also common in chronic indigestion, and extremely common in people who smoke too much.

Another condition that leads to cough is elongation of the uvula, due to cold which has relaxed the muscles of the pharynx. In other cases where you get cough, you see large tonsils, or you believe that the patient is suffering from adenoids. Both of these conditions may give rise to cough. As to adenoids, when you look down the throat of a child suffering from adenoids, you may see absolutely nothing; its tonsils may be

normal, and the adenoid tissue is entirely invisible. Adenoids usually block up the posterior nares, but you may have a lot of adenoid tissue present in the pharynx which does not obstruct the posterior nares in the slightest degree. I am trying to point out that lots of children have an abnormal condition of adenoids, which even may be suppurating and causing glands in the neck, and yet have nothing visible in their pharynx, and no obstruction of their posterior nares. The only way to determine whether adenoids are present is to stand behind the child, push its cheeks between its teeth, so that it cannot bite you, for it would have to bite itself first, and then put your finger up the back of its nose. That is perfectly easy to do.

The question is, what would make you think that a person's cough was almost certainly of pharyngeal origin, apart from what you see? It is quite easy to determine, from the sound that people make when they cough, whether they are coughing up stuff from the lungs or whether the cough is simply of pharyngeal origin. One thing that should raise your strong suspicion about a cough which is not bronchial, and has nothing to do with the respiratory track, is this—that the cough practically occurs only night and morning. The reason why some people cough when lying down has, as a rule, something to do with their uvula; why others cough when they rise up in the morning I cannot explain. But people whose cough is entirely pharyngeal cough almost entirely night and morning. It is extremely violent, as a rule, and they bring up a little sticky, dirty mucus, but not much purulent secretion. Then, again, people with pharyngeal cough undoubtedly complain to you of hæmoptysis. It is very common to have patients who are said to be suffering from early phthisis, merely because they have blood-stained expectoration. But everybody who has blood-stained expectoration has not got phthisis. That is a most important thing to impress upon students, because nowadays, if it is suggested that a person has got early phthisis, he is sent to a sanatorium for six months, and that is a serious matter, unless it is absolutely essential. Nor should a diagnosis of early consumption be made in too light-hearted a way, because of the consequences upon your patient of telling him that such is the fact. The hæmoptysis that people bring up from their pharynx is a glairy sort of mucus, with long streaks of blood, very often; whereas, in consumption, people, as a rule, cough up small quantities of pure blood, or blood practically unmingled with anything.

As to the treatment of this condition of the pharynx, I would say, first, do not give your patient gargles. If you want to get between the anterior pillars of the fauces, or to the back wall of the pharynx, it is not the slightest use giving gargles; the stuff will never reach the parts affected. Painting is one certain way by which you can get at the parts affected, but most patients probably paint everything excepting those parts; they paint the tip of their tongue, the soft palate, the hard palate, but never get the stuff into their pharynx, which is the part that they should try to get at. Another way of reaching the pharynx efficiently is by a spray. That means, of course, that the patients must get the necessary instruments, but, unfortunately, out-patients, as a rule, cannot afford to purchase them. Sprays, however, are a most effectual way of getting the fluid on to the whole of the back wall of the pharynx and all the adjacent parts.

I have already said something about mistaking these

people for cases of early phthisis. When I took over the out-patients here, I had, as one of my legacies, a perfectly healthy and strong-looking girl who had been regularly up to the hospital for four years with a diagnosis of early phthisis. It was put down on the letter that "there were no physical signs." A person, of course, who has had consumption for four years without physical signs, is either perfectly well or else she has not had consumption at all. This girl told me that every morning she had blood-stained saliva in her mouth, and there was sometimes some on the pillow. I examined the inside of her mouth and found that she had got a large polypus at the front of her back teeth. That was taken out. I want to emphasise the fact that it does not follow, because a person has got hæmoptysis, that he has also got phthisis. It is most important, therefore, to examine the person's pharynx and mouth carefully, in order to ascertain that there is not some perfectly obvious cause for the hæmoptysis. As a matter of fact, from the character of the hæmoptysis, and the time of day that it usually occurs, you may be able to come to the conclusion that the case is not one of tubercle of the lung at all.

With regard to bronchitis, which is the other, on the whole, most common cause of cough, you can often, by ascertaining the symptoms, get a fair idea as to whether these people's cough is due to bronchitis or not. Persons with bronchitis have very little expectoration, and, as a rule, they experience a sense of tightness of their chest, which is not present in pharyngeal cough. This tightness of the chest indicates that the respiratory mucous membrane is inflamed, and so it is that patients thus affected will tell you they feel "cold air" going down their chest.

As to the use of expectorants in bronchitis: The mechanism for getting fluid out of the bronchial tubes is twofold. You can only empty your large bronchial tubes by coughing. Then, secondly, in order to get the fluid from the small into the large bronchial tubes, there must be shedding of ciliated epithelium, to a large extent. If all the ciliated epithelium in the smaller tubes has been shed, the patient will not be able to get rid of the fluid by coughing. But so long as you can get these people to expectorate, then you may hope that the case will go on satisfactorily.

Now what is your object in giving an expectorant for bronchitis? According to your object you will prescribe your drug; though, let me tell you, I do not believe that any expectorant ever cured bronchitis. But why do I give an expectorant, how long do I give it, and when do I stop giving it? Take a patient who has got a really severe attack of bronchitis. He feels frightfully tight in the chest, and this sensation is a very material discomfort indeed, and you have got to relieve it by treatment, you have got to give an expectorant.

There is one other reason for which I give an expectorant in bronchitis. In the early stage of the disease the patient has in his tubes a thick, viscid fluid, and it requires an enormous effort on his part to cough this stuff up. This effort may be very considerably lightened if you render the secretion more liquid by giving an expectorant. As soon as you have changed the patient's rhonchi into a large rale it means a more liquid state of the sputum, and if you then go on giving your patient expectorants in the same degree as before you may do him a deal of harm. In a rather bad case of bronchitis you may hear rhonchi in the upper part of the chest and rales at the base of the tubes, which means that the patient's expectoration is trickling down the tubes and not coming up. It is, therefore, quite clear that a fairly liquid secretion is a secretion which the patient has not the power to expectorate. You do not now trouble, therefore, to make the secretion more liquid by giving an expectorant, else the patient will be unable to cough it up.

There are conditions, then, in which you must hold your hand in the giving of expectorants. Whenever you see cases of capillary bronchitis, whether in an adult or in a child, but especially in a child, let nothing persuade you to give these people expectorants. By

capillary bronchitis you mean bronchitis of the small bronchial tubes, and you recognise it by hearing all over the lung what are not much louder than crepitation sounds in a case of pneumonia. When you hear these crepitations, and whenever the patients are a bit cyanosed, do not give them expectorants. They are already cyanosed because they cannot get the stuff up. The same is true with regard to broncho-pneumonia, with bronchitis in children. In children there are two kinds of broncho-pneumonia, and these you can distinguish by the physical signs. On examination you may hear in one child's chest, with broncho-pneumonia, the ordinary physical signs of lobar-pneumonia and general bronchitis. In another child you hear patches of bronchial breathing dotted about the chest, and all over the chest there is general bronchitis as well. The first is a pneumococcal primary disease of the alveoli; the second is very often a streptococcal bronchitis which has spread to the alveoli and produced broncho-pneumonia. You may give the first child expectorants if you like, and you may benefit it thereby. But do not give the second child expectorants, because its bronchitis has affected its small tubes to such an extent that the alveoli are diseased, and if you go on pouring ipecacuanha into a child like that, you will certainly help to drown it. That is what generally kills those children.

Another condition in which you should not give expectorants is that of œdema of the lungs, due to heart disease or other causes. In cases of œdema of the lungs you hear fine crepitations, not much louder than pneumonic crepitations, dotted about the lower lobes. Even if these people cough a little, and perhaps bring up blood-stained sputum, do not give them expectorants; you can do them no real good by giving these, and you may do them a great deal of harm, because the trouble is for them to get the stuff out of their bronchial tubes.

There is one other condition in which you should not give people expectorants, and that is when they have acute lung disease and when, instead of coughing, they do not cough at all. That is a most serious condition of lung disease because when their respiratory centre has reached a stage of either circulatory failure or general narcosis, when, as a fact, it ought to be producing dyspnoea and cough, they are then certainly within measurable distance of death. To give these people expectorants is most ridiculous, because they cannot bring up the stuff that they are making, much less the stuff that you are going to persuade them to make. I would also say do not give them opium, because opium does not stimulate the respiratory centre. What you have got to do with these people is to wake up their respiratory centre so as to bring on cough and dyspnoea. The best way to effect this is by giving them oxygen until they are pink, not *slightly* pink merely, and to get them pink it may be necessary to keep them twenty-four hours under oxygen.

There is other treatment that you may adopt in these cases. You may give these people such drugs as will tend to stimulate their respiratory centre, such drugs as strychnine, or strophanthine. Or, in the case of adults, but never in children, you may rub them with block ice. If you want to stir up a person's circulation, or raise his blood pressure, the way to do it is to stimulate the sensory nerves in his skin, and this can be very effectually brought about by wrapping the patient in a sheet and rubbing him with block ice. That will wake up his respiratory centre, if anything will. You cannot do that with children, or even with adults who have already reached a condition of sub-normal temperature; it is only possible to do it in adults, and only in adults, who have considerable pyrexia. You know that the surface of a child's body, as compared with its bulk, is very different to that of an adult, and you cannot afford, in children, to extract enormous quantities of heat out of their bodies with such things as ice. If you do use ice, you must use it with profound care.

In the case of children, the old-fashioned treatment was to give them emetics when they had ceased to

cough, in order that by forcible contractions of their diaphragm they would not only vomit the contents of their stomach, but also empty their bronchial tubes. It is perfectly true that occasionally this can be done. But emetics are powerful depressants, and if a person is already in a rather bad condition it is quite obvious that you should not try to make him sick by an emetic, unless you think it is the lesser evil of the two. Then, again, by the time that his respiratory centre has got so dulled that he won't cough his vomiting centre is in much the same condition, and therefore it is extremely difficult to make him sick by ordinary emetics. Apomorphia is not the class of emetic that should be used, simply because it is so tremendous a depressant to the whole circulation and to the body generally. In the early stage you certainly can make children sick, but I want to point out that when they have got too far you cannot even do that. I have even tickled their throats with feathers to try to make them sick, or cough, but their throats have been absolutely insensitive to tickling. Another means that may be adopted is to try and make them sneeze by giving irritating snuffs, so that in sneezing they may empty the base of their lungs. The moral of all this is: If you can prevent it, never let a person get into this condition; immediately he shows any sign of it give him a powerful emetic and so endeavour to stave it off.

Another subject that I want to say a word about is that of cough in heart disease. Supposing that you get a person who is in bed with cardiac disease, and coughing until he is blue in the face, what is happening to his circulation? He is getting up a positive pressure in his thorax, and thereby making the return of venous blood into his thorax so much the more difficult. That does not improve the circulation in a person with heart disease, because what is wanted in such a case is to get the blood out of the veins into the arteries, and not to dam it back by keeping it in the veins. As a result of this positive pressure in the person's thorax the pressure in his pulmonary artery is raised enormously, and also, of course, that in his right heart, and if you allow that condition to continue without interference in anyone suffering from cardiac disease you are not showing a very profound knowledge of the circulation. I want to point out that coughing, in heart disease, from whatever cause the coughing may ensue, is a very serious thing.

Another condition in which coughing becomes serious is in people who have either already got, or had, a cerebral hæmorrhage, or in people who have got bad cerebral arteries. If you ask any clinician what are the predisposing causes of cerebral hæmorrhage, he will tell you "such things as straining at stool," whereby you get up positive pressure in your thorax. And Hill showed, years ago, that pressure in the cerebral arterioles is influenced much more from the venous side than from the arterial side of the circulation; and as the act of coughing sets up positive pressure in the latter area it is obviously a most serious thing, especially if violent, in a person who has got soft or bad cerebral arteries.

The last thing I am going to say a word about is cough in phthisis. One of the commonest ways in which tubercle is spread about in the lung is by aspiration of the tuberculous material into the healthy bronchial tubes. When you breathe in you suck this material into the healthy bronchial tubes, and so spread the disease. It is perfectly clear then that a person with tubercle should cough in order to bring this stuff up. Your object in treating people with phthisis is not to stop the cough altogether. In most cases the right attitude to take is to give these persons a dose of something that will secure to them so many hours' freedom from cough at night, in order that they may get refreshing sleep, and then leave them alone during the rest of the day unless their cough is violent. To give these patients doses of morphia, or opium, four or five times a day, as is often done by the ignorant, is to my mind ridiculous, because it does not effectually stop their cough. Moreover, there is no drug which so

thoroughly upsets a person's vitality and digestion as opium in any form whatever, and, as you know, his digestion, his appetite, is the principal thing about his prognosis. There is no doubt that hyaline is an effectual drug for stopping the cough, and is certainly much less calculated to upset the digestion and appetite than such preparations as morphia or opium.

There are conditions in phthisis when you must stop the cough at all risks. The most common one is hæmoptysis, and the way to stop the bleeding is certainly to give the patients, as a start, an injection of morphia. In cases where hæmoptysis occurs in phthisis they get for a considerable time afterwards a rise of temperature and further physical signs in the chest, such as an outbreak of miliary tubercle; these things being the result of the aspirating of the blood, mixed with tubercle bacilli, about the healthy chest.

In phthisis there is hæmoptysis and hæmoptysis. In those cases where there is very little bleeding you are dealing more with a pneumonic condition than with cavitation, and it does not matter when they have hæmoptysis. But in a case of phthisis where there is cavitation and much hæmoptysis you are dealing with a large number of blood-vessels, and if you allow those persons to go on coughing, and coughing violently, they may die from the hæmoptysis.

NOTE.—A Clinical Lecture by a well-known teacher appears in each number of the journal. The Lecture in next week's number will be by A. Matiland Ramsay, M.D., Professor of Ophthalmology, at St. Mungo's College, and Lecturer on Eye Diseases, at Queen Margaret College, University of Glasgow, on "Inflammation of the Conjunctiva."

ORIGINAL PAPERS.

MODIFIED DRIED MILK FEEDING OF INFANTS AND YOUNG CHILDREN.

By D. SOMMERVILLE, M.D., M.R.C.P. LOND.,
Lecturer on Public Health at King's College, London.

AND

FRANCES M. HARPER, M.B., D.P.H. CAMB.

IN 1905 one of us determined the compositions, and digestibilities (by laboratory experiments), of a number of desiccated milks; and a brief account of a variety that presented constant composition, and behaved uniformly under gastric and pancreatic digestions, was published in the October number of *Public Health* of that year. It was then claimed that in respect of its reaction to rennin, to peptic digestion, to pancreatic digestion, and in respect of the digestibility of its fat, when properly reconstituted, this milk approached more nearly to human milk than does raw cow's milk. Subsequent investigation has shown that the product is sterile, and that when packets are opened the contents are much less liable to invasion by bacteria than bottled or tinned milk in the liquid or semi-liquid state. A two-pound tin, for example, may be left open for six months, and when the superficial half-inch of powder is removed the remainder is sterile. The importance of this fact in connection with the distribution of milk, more especially amongst the poor, is obvious.

In order to test the product as a food for infants and young children, we selected a district in East Central London, where we supplied babies of all ages, from four weeks to nine months, with a milk powder, modified by the addition of lactose, &c. A scale of quantities was constructed for

the different ages, and amounts for individual meals were weighed, packed in clean willow boxes, and given to the mothers, with instructions for the proper reconstitution of the milk and times of feeding.

Records have been kept of each child, including date of birth, date of commencing the diet, general physical condition, character of stools, nature of previous feeding (breast, cow's milk, condensed milk, &c.), health conditions of the mother, and weekly increase in weight. Since November 1st, 1905, we have studied the effects of the food on fifty-five babies. More than 60 per cent. of the mothers had no breast milk, and the remainder had a very deficient supply which in many cases disagreed with the child. Twenty-seven children have lived wholly on the product for three months, and in all definite improvement has taken place. Where nausea and vomiting existed in babies fed on cow's milk and barley water, change to the dried preparation was generally successful in cutting short these symptoms in twenty-four hours. The characters of the stools improved rapidly in all cases, and this is an important feature in the effects of this food. The change for the better was greater in cases previously fed on condensed milks. The swollen and tense abdomen found in 75 per cent. of these cases became small and soft, and screaming and whining ceased. Where wasting had occurred on breast milk, the improvement was equally great and rapid.

Increase in weight of five ounces weekly has been recorded in several cases; in a less number six ounces weekly; and the average for the whole number is over four ounces.

When it is considered that more than one-third of these children suffered from congenital syphilis or rickets, and that several were at first so wasted that they must have inevitably died in a limited period, we think that the results will be deemed satisfactory.

It would therefore seem that there is a place for this dried milk food amongst the poor, where breast feeding is impossible, where clean and modified cow's milk is not to be had, or where it disagrees, and in all cases where condensed milks are used it is advisable to administer occasionally orange juice, raw egg albumin, or raw meat-juice.

Its sterility and the absence of dense clot in the infant's stomach under the action of rennin bespeak an important position for the product in time of epidemic diarrhoea.

THE DIAGNOSIS OF SOME ACUTE ABDOMINAL DISEASES.*

By A. S. BARLING,
Surgeon to the Royal Lancaster Infirmary.

MR. CHAIRMAN, GENTLEMEN,—It gives me very real pleasure to come among you once more and I value very highly the privilege that you have conferred in allowing me to talk over with you the diagnosis of some acute abdominal diseases. If I can arouse your interest, and thereby incite some of you to relate your experiences and express your opinions—often of wider range and of much greater value than my own—our object will have been attained and our time will not be ill-spent.

The cardinal symptoms presented by these cases are :

—(1) pain; (2) shock; (3) vomiting; and (4) though this is not always present, obstruction and consequent meteorism.

I think you will agree when I say that no more difficult problem ever confronts the medical man than that of forming a diagnosis, and indeed it is not infrequently impossible to do so. When the beginning is sudden and dramatic, and the patient in great suffering, the friends are alarmed and the medical attendant on the alert; but when it is more insidious it is sometimes difficult to convince them of the gravity of the condition until it is too late.

It is of the utmost importance to decide at the earliest possible moment, whether the case is one which calls for surgical interference or whether it is likely to be amenable to medical treatment. Certain cases always require operation, others never do so, but unfortunately the majority fall into a class midway between the two and are a source of much perplexity and anxiety to all of us.

The first thing to be done when confronted with one of these is to obtain from the friends, corroborated, if possible, by the patient, a full and detailed account of the time and manner of the onset, not forgetting to ask for any exciting cause, such as a fall or a strain. Having elicited this, inquiries should be made into the previous history. Possibly we may hear of a former attack of appendicitis, or of gall-stones, or renal colic accompanied by hæmaturia, or there may have been progressive constipation with wasting or melæna, pointing to malignant disease, or symptoms of ulcer of the stomach, or enteric fever.

In a woman the menstrual function should receive careful attention having in mind a possible extra-uterine gestation. Kelly even quotes a case in which the appendix was removed and it was discovered at the *post mortem* that the condition was due to a criminal attempt at abortion.

And now as to the aspect of the patient. You will generally find him lying on his back with his knees drawn up and his hands above his head. His face is that of one suffering from serious illness. At first there may be merely an anxious drawn expression, and the face may be flushed. Later it becomes pale or blue and pinched, and there is a gradual change until the appearance described by Hippocrates is presented. Doubtless you all remember it, but we may perhaps with advantage recall it.

"A sharp nose, hollow eyes, fallen temples, cold, contracted ears with the lobes inverted, the skin about the forehead hard, streaked, and dry; the colour of the whole face pale, or black or livid, or like lead," and he goes on to say, "If the countenance appears thus at the beginning of the disease it ought to be inquired whether the patient has been watchful, or had a violent purging, or been oppressed with hunger. For, if any of these are owned, the danger is to be esteemed so much the less, and the crisis happens in 24 hours where the countenance is changed by these causes. But if none of these are in the case, nor a reinstatement happens within the time now mentioned, it is a certain sign that death is near at hand."

If the *alæ* of the nose are working it is a bad sign, as showing great interference with respiration due to limitation of the movements of the diaphragm.

Restlessness is a grave symptom, as is also its antithesis, apathy.

The pulse is quick and small; if its rate is 100 and this persists for some hours, operation is imminent. If it is also intermittent, this is an additional reason for haste.

The temperature is often very misleading. It ought to fall, in a favourable case, on the second day. A low temperature, accompanied by a fast pulse, is very ominous.

Vomiting is almost universal at the beginning of any acute abdominal attack, but if the course tends towards recovery it soon ceases. If it persists or recurs, it is a notable danger signal.

The quiet, ceaseless pumping up of large

*An Address delivered before the Furness Division of the British Medical Association.

quantities of thin bile-stained fluid is a sign of the most serious import.

*The tongue very early becomes coated, and in the later stages is dry and cracked.

And now let us dwell for a few moments on the symptom which most appeals to the patient. I refer, of course, to pain.

At first this is often general or confined to the umbilicus, but after a few hours it almost always becomes localised and its position offers a very fair guide to the seat of the mischief.

If the pain is *Epigastric*, we think of—

- 1.—Rupture of ulcer of stomach.
- 2.—Acute dilatation of the stomach.
- 3.—Rupture of ulcer of duodenum.
- 4.—Diaphragmatic pleurisy.
- 5.—Pneumonia.
- 6.—Acute pancreatitis.
- 7.—Gall-stones.

If *Umbilical*—

1.—The various forms of obstruction of the bowels (more especially affecting the small intestine).

If *Hypogastric*—

- 1.—Pelvic appendicitis.
- 2.—Various conditions of the female generative organs.

If *Iliac*—

- 1.—Appendicitis.
- 2.—Ruptured tubal pregnancy.
- 3.—Pyo- or hæmato-salpinx.
- 4.—Twisted ovarian pedicle.

If *Lumbar*—

- 1.—Stone in the kidney.
- 2.—Torsion in movable kidney.
- 3.—Stercoral typhlitis.

Hypogastric pain, accompanied by rigidity in both recti is almost diagnostic of pelvic appendicitis—at least in the male.

There is a curious reflected superficial pain over the right iliac region in appendicitis.

In obstruction the pain is of three kinds, according to the stage. There is first a stabbing pain due to the actual injury to the peritoneum, this is followed by a colicky pain caused by the efforts of the bowel to expel its contents, and, lastly, there is the constant pain increased by pressure due to peritonitis.

The pain caused by rupture of any organ is said to be very sudden, and often agonising in its intensity. I have, however, seen cases in which the rupture of an appendix has been followed by marked temporary relief. This, I take it, being due to the lessened tension.

And now let us come to the examination of the abdomen. The patient should lie perfectly flat in a good light which falls equally on both sides.

On inspection we shall notice whether the abdomen is distended or no, and if so, if the distension is symmetrical.

Then we shall note the amount of movement during respiration and if it is general or only occurs in the upper part. It may even be unilateral. An excellent example of this occurred in a case that was brought down to me by Dr. Martin, of Kirkby Lonsdale, a week ago this evening. A boy, æt. 9, was in the morning suddenly seized with severe abdominal pain, accompanied by vomiting. The pain, at first general, had become localised at a point above and to the left of the umbilicus, the respiratory movements on that side were decidedly less marked than on the others. On opening the abdomen, it was found that a portion of the small intestine had slipped between an omental adhesion and the parietes at the point indicated by the pain.

If the movements are free, the presence of serious mischief is not likely.

There may be local distension as in appendicitis, or sub-diaphragmatic abscess.

Coils of distended intestine may be seen. Having learnt all that is possible from inspection, we now try what palpation will reveal. I need not enter into

the manner in which this ought to be carried out, you all know it; but let me remind you to do it systematically, each organ being examined and thought about separately. Never allow your thoughts to be lured away from the particular part that is under investigation. (It is as bad as thinking of the bunker when you are playing an approach shot, and we all know what is likely to happen in that case).

The things to be sought for are:—

- 1.—Tenderness.
- 2.—Rigidity.
- 3.—The presence of fluid in the peritoneal cavity.
- 4.—Any local enlargement. In this connection let us never forget to examine most carefully all the points at which hernia may occur. It is not at all difficult to overlook a Richter's hernia.

We now proceed to employ percussion.

Personally, I do not attach great value to it, and although I have a good ear for music, I have never been able to tell with any degree of certainty whether a given note was the resonance of the stomach or of a distended colon.

There is one condition, however, in which it is of the greatest value. I refer to a suspected perforation. If the liver dulness is gone, the abdomen not being greatly distended, we may be tolerably certain of free gas in the peritoneal cavity. Auscultation may be of use in determining whether the obstruction is due to mechanical interference or to paralysis of the gut. Rectal and vaginal examinations should never be omitted. In the majority of cases they do not help us, but occasionally very valuable information is obtained. The apex of an intussusception or an inflamed mass in the pelvis, or even an appendix may sometimes be felt, especially in children. Never omit a careful examination of the chest and urine.

Having completed our examination, it may be well to clear the ground by eliminating a few of the commoner conditions which respond to the services of the physician.

The first that occurs to me—perhaps from my four years' residence in the Potteries—is lead colic. The patient is usually not in bed, the pain is paroxysmal, confined to the umbilical region, and the abdomen is flat. An examination of the gums and a look out for any signs of peripheral neuritis or anæmia or albuminuria are generally sufficient to establish the diagnosis. The use of lead as an abortifacient may be remembered.

The gastric crises of locomotor ataxia are sometimes alarming, but they need not detain us; a glance at the eyes and a tap on the patellar tendon suffice. Nearly allied to these are the gastric crises which occur in morphia takers, and which I fancy are not so well known. They usually appear when the patient is diminishing the dose of his drug. There is first a feeling of indigestion, with fulness about the pit of the stomach. This may last for some hours, but sooner or later is followed by a dull constant aching pain in the epigastrium; this rapidly grows worse, and may become so bad as to prostrate the patient completely. Vomiting and alarming collapse follow. I have mistaken it for a ruptured gastric ulcer. The treatment does not concern us to-day.

Another class of case occurs to me in which we see all the signs of acute abdominal mischief, but which are secondary to some thoracic disease. This emphasises the importance of a routine examination of the chest in all cases. The abdominal symptoms are of little importance and soon give way to calomel and magnesium sulphate. I have recently seen two very interesting examples of this; one last summer with Dr. Troughton, of Bentham. A boy with patches of catarrhal pneumonia in both lungs had also abdominal pain and distension. It was a question whether he had appendicitis, but the whole thing cleared up and he got well. The other case a month or two ago, with Dr. Penny, of Greenodd, occurred in a young woman. She had pain at the epigastrium, distension of the abdomen, vomiting and constipation.

There was also consolidation at the base of the left lung. The abdominal symptoms disappeared under aperients, but unfortunately the lung became gangrenous and the patient died some weeks afterwards. I know of one case which was operated on under the impression that it was one of acute obstruction. Nothing was found, and at the *post mortem* the cause of the symptoms was revealed in a lung consolidated by pneumonia.

The order of things is sometimes reversed, and empyema is a recognised sequel of appendicular abscess. It is not very common. I only recall two cases in my own practice.

Acute dilatation of the stomach is worthy of mention and may closely simulate rupture. I well remember a case in which I operated for my colleague, Dr. Rayne, last year. The patient, a young woman, had been in the Royal Infirmary for some weeks suffering from undoubted gastric ulcer of some years' standing. During that time she had had several attacks of hæmatemesis. Suddenly one day she was seized with agonising pain at the pit of the stomach, and vomited partly digested blood. When I saw her some hours afterwards she was in a state of collapse, pulse hardly perceptible. The abdomen was moderately distended, the liver dulness obliterated. She was put under ether and the abdomen opened. There was no perforation, but the stomach was greatly distended, reaching down to a point midway between the umbilicus and the pubes.

It was washed out through an œsophageal tube and several pints of altered blood removed. A gastro-jejunostomy was then performed. Unfortunately the patient only survived for a few days.

Another condition in which epigastric pain is a leading characteristic is pancreatitis. We all remember that after the King's illness it became fashionable to suffer from appendicitis. Society, however, discovered that not only kings, but even quite common people were afflicted by it. Gall-stones then for a short time became all the vogue, but this year I am told that nobody can hope to be received in the best circles unless he has pancreatitis. Not a great deal is known of it as yet. The conditions with which it is most likely to be confounded are intestinal obstruction, and perforation. Fitz describes the symptoms as follows:—

"Acute pancreatitis is to be suspected when a previously healthy person, or a sufferer from occasional attacks of indigestion, is suddenly seized with a violent pain in the epigastrium followed by vomiting and collapse, and in the course of 24 hours by a circumscribed epigastric swelling, tympanitic or resistant, with slight elevation of temperature. Circumscribed tenderness in the course of the pancreas and tender spots throughout the abdomen are valuable diagnostic signs."

"There is prostration, often extreme, frequent collapse, and a feeble pulse. Obstinate constipation for several days is the rule, but diarrhœa sometimes occurs. If the case does not end fatally in the course of a few days recovery is possible, or a recurrence of the symptoms in a milder form takes place and the characteristics of a sub-acute peritonitis are developed."

The recurrent shock seems to me to be the most valuable diagnostic sign.

If the abdomen is opened and no obstruction found, a look out should be kept for fat necrosis. This mostly occurs in the omentum, mesentery, and pancreas, where it forms the well-known islands of Langerhans.

A case that I saw last summer at the County Asylum in consultation with Dr. Cowen is interesting as bearing on this point.

The patient, a fat, middle-aged woman, had some hours previously been struck violently in the epigastrium by the knee of another inmate. She collapsed and shortly afterwards vomited. When I saw her she was recovering from the shock, but the abdomen was becoming distended. As the liver dulness was unaffected, and as the symptoms seemed, if anything, to be abating, we decided to wait and treat symptoms. She had obstruction for 24 hours, which then gave way to turpentine enemata. The following day she again collapsed, and again on the day after, but then

made a good recovery. We made the diagnosis of a hæmorrhage into the pancreas. I ought to have mentioned that she seemed to have great epigastric pain and tenderness, but owing to her mental state it is difficult to speak definitely. There was some swelling on the second day, but no definite tumour could be felt, nor any abnormal want of resonance.

Having now considered, and if possible eliminated, the cases which recover under medical treatment, we come to the great mass of those which exhibit peritonism and which require surgical skill for their cure.

They may be broadly divided into—

1.—Acute strangulation.

2.—Peritonitis.

These may, of course, be due to a very large number of conditions which time will not allow us to discuss. The relative frequency of the two states does not help us much as the following table, taken from Battle and Corner's book on the Appendix, will show. They tabulate 456 cases of acute abdominal affection which were treated at St. Thomas's Hospital. Of these 37 per cent. were due to appendicitis and its complications, 40 per cent. to obstruction, and 11 per cent. to perforation. We see that 48 per cent. were due to peritonitis, and 40 per cent. to obstruction. It may be useful to consider for a few moments the signs and symptoms pertaining to each of these two great groups and endeavour to distinguish between them.

As regards the *onset*, it is abrupt in obstruction but in peritonitis may be preceded by local pain.

In obstruction there is never a *rigor*. In peritonitis it is often present. The *temperature* in obstruction is sub-normal, at first rising as inflammation sets in; in peritonitis it is generally high at first, falling later from exhaustion or toxæmia.

Pain is severe in both classes, but in the former is most often referred to the umbilicus, whilst in the latter the right iliac region is often affected.

Tenderness is absent at the beginning of obstruction, whilst it is a marked sign even in the early stages of peritonitis.

Vomiting comes on early in obstruction and soon becomes fecal; in peritonitis it is less urgent and rarely fecal, except towards the end.

Rigidity is absent in obstruction but marked even in the early stages of peritonitis. Sometimes a peritoneal rub can be heard by means of the stethoscope.

A leucocyte count is of great value if taken early. If the leucocytosis is high—over 20,000 to the cubic millimetre—and is rising it is a sign of inflammatory mischief.

Even with the greatest care it is impossible in the majority of cases to make a minute diagnosis before opening the abdomen, and indeed this must be so from the very nature of things, but it is well to form some rough working theory, if only to guide us in the choice of the site of an incision.

It would be useless to attempt to enter into the minutæ of the differential diagnosis of the hundred or one causes of acute symptoms, but taken as a general rule the seat of pain and tenderness will be a trustworthy indication as to whether the incision should be made in the mid-line above or below the umbilicus, over the gall-bladder, in the iliac region or even in the loin.

I recall a case sent to me by Dr. Shaw, of Bowness, which presented the appearance of obstruction, but in which the symptoms were due to a twisted floating kidney. A nephrorrhaphy cured the patient.

The best imitation of an appendix case that has come under my care was that of a middle-aged woman sent to me from Wennington by Dr. Bradley some eighteen months ago. She had every sign of appendicitis, even down to the presence of a fluid tumour—immovable—in the cæcal region. I had the doubtful satisfaction of removing through a lateral incision an ovarian cyst about the size of a large orange which was becoming gangrenous from torsion of its pedicle.

I had intended to tell you of three suppurating hydratids, one of which burst into the duodenum, which

simulated everything except what they really were; of a few gall-bladders which showed abnormal symptoms, one being opened opposite to the iliac spine; of an appendix in which I counselled delay because of a cessation of vomiting and a falling pulse and temperature, but which subsequently revealed a huge post colic abscess; of a case of impeded fæces; of one that I took to be entero-spasm, and of two ruptured tubal pregnancies, but the plaguey old man with the scythe and sand glass is menacing me, so I must submit.

In conclusion, then, let us again recall those things which weigh most when we are balancing the great question, operation or not?

If, some hours after the onset, the general appearance of the patient does not indicate improvement, the pulse is 100 or over, the vomiting not abated and the bowels not relieved by enemata, there ought to be no further delay.

Many a time and oft have I regretted holding my hand, but never have I been sorry for operating. It is better to interfere unnecessarily in fifty cases than to allow one to die without a chance being given to him. If done early a mere opening of the abdomen—primarily for diagnostic purposes—is not a matter of great danger.

Finally, if you have any reasonable doubt as to the course to adopt, I say operate, and again operate.

TREATMENT OF DIPHTHERIA.

By RICHARD WOOD, M.D. ST. AND.,
Llanbedr, North Wales.

WHEN we are called to a case of diphtheria there is at once a feeling of anxiety and doubt in our own mind as to the result; few diseases more severely tax our resources than this one. We have to think of so many details, of hygiene, diet, and medicine. With regard to medicine, up to the present time, none has been discovered upon which any reliance can be placed; and as to the so-called specifics which are recommended by some authorities, they are sure to fail when put to the test.

In the year 1891 this hopelessness and despair of successful treatment became changed for one full of promise and hope when Professor Behring introduced the antitoxin treatment, which, if applied early enough and the serum used in sufficient quantity, appeared destined to take the first rank in saving life. But even in this hope there was much disappointment. There was always delay in obtaining the antitoxin serum, and when obtained the parents did not always sanction its use, or the medical man in attendance had his doubts about the dose to subcutaneously inject. And even now, if you ask various authorities as to the quantity, one will tell you, for a child of 10 years, to inject 400 units every three hours for a couple of days. Another tells you, you must not give less than 600; and you may give 1,000 units. And yet a third, that it is perfectly useless to give anything less than 1,500 units to 2,000. And still another, that he gives in very severe cases, to a child 6,000 units, and to an adult 12,000. When you find such a difference of opinion it is not surprising you feel in doubt as to what the dose really is, and you finish by coming to the conclusion that you may give any dose and hope for good results. If some men give 600 units with good results, why give more? and how are you to decide, in one instance to give 600 and in another to give 1,000? or again—when are you to give it every three hours, and when only once in the 24 hours? And besides this difficulty others arise, as to the mode of giving it. Some men prefer to give it by the mouth and others by the rectum.

Not very long ago I treated a case following measles, and after three or four injections hypodermically the little patient died. An action was entered against me for causing the death of the child by the injection of the serum. I was very much disconcerted by this, and my ardour in applying the serum cooled considerably. The ingratitude of the public is monstrous. We

expose our lives to all kinds of infection, and there are people ready to prosecute us at every turn if they think they have a chance. In my case the action was withdrawn at the last moment, but my legal expenses had to be paid.

Before the antitoxin serum came into use I had occasionally applied hydrochloric acid to the throat, and now and then recovery took place. But there was much difficulty in the application; and hoping that some other form of chlorine might answer, I applied chlorine in the form of gargle, which answered with adults but not with children. I then adopted the spray, and gave directions for its application every half hour, night and day. Many mothers and nurses begged of me not to enforce it during the night; but I found if an hour or two passed without using it there was more difficulty in getting rid of the patches of membrane. In most of my cases where I could depend on the mother using the spray every half-hour, the patches sometimes disappeared in two days or three days. After disappearing, the half-hour was prolonged to two or three hours with directions to come back to the half-hour if any patches reappeared; and the attendants became quite keen and expert in looking after them. Of course, in addition to the frequent application of the spray it was essential to devise means and measures to support life by the administration of slightly alcoholic stimulants and easily assimilated food, like milk and beef tea—discarding altogether all those artificial extracts and various vaunted preparations. Medicines which have a depressing effect were zealously avoided. The abstraction of blood was never had recourse to on any account.

It seemed always to be a question as to whether your patient should be allowed to get up or to be kept in bed. Some authorities will insist on the little patient (speaking of children) being put to bed with bottles of hot water to retain the heat of the body, and they will keep the room at a temperature of 60°. But why? What reason can they have for it? Moreover, they insist on the patient being screened from every current of air, and yet the poor patient is suffocating from want of it; they order a screen carefully arranged so as to surround the child's cot, and a jet of steam to be directed towards the little patient; and by this means the child's strength is as much reduced as by the disease. A word of advice here would be to do unto others as you would be done by. I actually saw a poor child treated like this until drops of perspiration were running down the face, which was twitching and partly cyanosed.

I have treated a great number of children and some adults, but I have never deprived them of air. I have relied entirely on the chlorine spray, and I prefer it to the antitoxin treatment, which fails to show a greater percentage of recoveries than 17 per cent. The antitoxin serum may not be altogether at fault, as it is very much the habit of medical practitioners to give the serum without fully relying upon it, and so combine a kind of mongrel treatment, so that if the patient dies the serum is condemned—if the patient lives his recovery is due to their skill, and not to the serum. If reliance were placed on the effect of the serum, why order the patient drugs, and on no account to be removed from the bed, or to be raised from the recumbent position—even the bowels to be evacuated in the recumbent position, when there is no sign of heart complication? And again, if reliance is placed on the serum, why order brandy for children in quantities like 5 ounces to 10 ounces daily? which has been strongly recommended by some physicians.

With our present knowledge and experience of the serum I am not satisfied. It promised great things. I believe it is capable of better results than we can at present show, but we must wait for more exact knowledge as to the dose and mode of administration. And as there are many men in the profession who do not advocate the treatment, let them use the chlorine; but how are they to use it? I have had partners and assistants and locums—most men now consider it a

virtue to ignore the compounding of medicines, and when lately I tried to explain the method of producing the chlorine to a friend he turned upon me and exclaimed, "Surely, man, I am not a pharmaceutical chemist!" This method is as follows: Put in a dry bottle half a drachm of potassic chlorate; on the top of it twenty minims of strong hydrochloric acid, and cork it lightly. After ten minutes the contents of the bottle will look green. Add to it an ounce of water and shake briskly. Add another ounce and shake; and so on gradually until five ounces and a half have been added. Put in half an ounce of syrup to sweeten. This forms the spray. By way of medicine, which I give more to satisfy the friends than as a means of cure, I give some glycerine boracic with solution of borax in small doses every three or four hours, or a solution of chlorine in small doses of a teaspoonful every four hours.

From time to time I come across children of so refractory a disposition that they will not submit to the application of spray. I have had recourse in such cases to the following process. I have generated the gas in their immediate proximity, by placing a bottle close to the head of the bed, with a drachm or a drachm and a half of chlorate of potash in powder and a drachm of pure strong hydrochloric acid poured upon it, and the bottle left uncorked. In a few minutes the gas begins to pervade the room and the child cannot help inhaling it. I have done this four or five times a day with the happiest results. A fresh bottle must be used every time and care must be taken that it is perfectly dry.

In making the spray great latitude may be exercised as to the quantity of potash chlorate. A whole drachm or two drachms may be used, provided the acid be limited, of which I seldom use more than half a drachm.

In cases of membranous croup I apply the same treatment. I do not make a point of keeping patients in bed, nor excluding the air. I prefer opening the windows, night and day, although the room may be kept warm with fires. This mode of treatment is simple and the greatest reliance may be placed in it if carried out thoroughly, and by means of trustworthy nurses.

Before ending this paper I should like once more to call the attention of my readers to the importance of the mode of preparing the solution of chlorine, for to-day on referring to a very valuable little work on *materia medica*, by Hale White, he describes its preparation as follows (page 232):—Strong hydrochloric acid, *min. v.*; potassium chlorate, *gr. 9*; water one ounce; by which he would certainly obtain a solution of potassic chlorate and hydrochloric acid, but no chlorine. I daresay he takes for granted that any man of sense would know that in the first place the acid and potash must be mixed together and left in the bottle for some minutes until the production of gas makes itself evident by a green colour. But he does not say so. It is very necessary the acid should not become diluted by a few drops of water that might be in the bottle as chemical action will be lessened by the dilution. That was my reason for laying such stress on the bottle being quite dry.

If those who are going to give this treatment a trial fail to produce a green solution of chlorine, they had better not attempt it, for its trial will be a dead failure. Even to go on using the solution after it has lost its colour is no longer effective; and the best way of retaining the colour for a few days is by keeping the solution in a drawer in complete darkness.

THE OUT-PATIENTS' ROOM.

WESTMINSTER HOSPITAL.

Case of Latent Infective Meningitis.

By PURVES STEWART, M.D., F.R.C.P.

A YOUNG man, *æt.* 21, came to the Out-Patient Department on May 21st, complaining of headache,

diffusely distributed all over the cranium, of two weeks' duration, almost constant, and keeping him awake at nights; also nausea and vomiting after food, but no spontaneous vomiting. On further inquiries, it was found that for twelve months the patient had suffered from left side otorrhœa; this suddenly stopped a fortnight ago. Since then the headache had occurred. The patient was examined by Mr. de Santi, who found a dry perforation of the left membrana tympani without evidence of any mastoid or sinus trouble. Mr. de Santi therefore sent the man to Dr. Stewart for an opinion as to the cause of the headache. The patient was obviously ill; he had severe diffuse headache but no local tenderness over the mastoid, or anywhere else on the cranium; the pulse was 90, the skin cool, and the temperature normal. The left pupil was larger than the right, but reacted normally. Ophthalmoscopic examination showed a doubtful fullness of the veins at the inner side of both optic discs; the cranial nerves were otherwise normal, the sensory, motor and reflex functions were also normal. The history of the case was, Dr. Stewart thought, highly suggestive; the sudden stoppage of the chronic otorrhœa when followed by head symptoms was, he said, always suspicious, and therefore, notwithstanding the absence of abnormal signs on examination by an expert aurist, one felt disposed to suspect some intra-cranial infective process. Dr. Stewart pointed out that it was now clearly established that every form of meningitis was associated with an excess of cells in the cerebro-spinal fluid; in the acute infective varieties of meningitis the cells were of the polynuclear type, whilst in the tuberculous and syphilitic varieties mono-nucleated cells were found. If no excess of cells were present, meningitis could be excluded. Accordingly, Dr. Stewart performed lumbar puncture: the fluid withdrawn was turbid; this in itself, he remarked, was pathological and showed the presence of meningitis. Microscopical examination of the fluid demonstrated an enormous leucocytosis, the cells being of the poly-nuclear type. The diagnosis of an infective meningitis being therefore clearly established the patient was admitted to the hospital for immediate operation. This was performed by Mr. W. G. Spencer, who on exploring the middle ear found it full of cholesteatomatous debris. A complete Stacke's operation was carried out and the middle ear was left free to drain externally. The patient's symptoms at once improved, his headache ceased, and it became evident that the leakage of infective material from the ear into the cerebro-spinal fluid had been arrested. Up to then the patient continued to improve. No further examination of the cerebro-spinal fluid had yet been made, but that would probably be carried out at regular intervals.

Dr. Stewart said that this case recalled a rather similar one of an officer who had been the subject for many months of chronic left-sided otitis media; he somewhat rapidly developed mental dulness and slight aphasia with some fever. In this case also the cerebro-spinal fluid was turbid, and showed an enormous excess of poly-morpho-nuclear leucocytes numbering no fewer than 371 in a field of 400 diameters. Operation was at once undertaken by Mr. Ballance, an infected area of brain cortex was exposed in the left temporoparietal lobe; no abscess was found. The symptoms rapidly subsided, and the patient made a complete recovery.

OPERATING THEATRES.

GREAT NORTHERN HOSPITAL.

NECROSIS OF THE LOWER END OF THE FEMUR.—MR. PEYTON BEALE operated on a boy, *æt.* about 10, who had been admitted with a sinus in the popliteal space. A probe on being inserted came upon bare bone, which from its position appeared to be about one inch below the bifurcation of the linea aspera. As regards

the previous history the patient had noticed a swelling in his popliteal space some two months previously; this had rapidly got larger, was very painful and burst through the skin in a few days, discharging about two ounces of pus. The case was considered to be one of necrosis at the back of the lower end of the femur, a not very uncommon condition, but one the pathology of which appeared to be very obscure. A vertical incision about six inches long was made in the middle of the posterior aspect of the thigh, its lower limit being midway between the two condyles. The popliteal vessels were pulled towards the inner side of the incision by a spatula; it was then found that the periosteum covering the triangular portion of bone at the back of the femur was bulging and on this being incised some thin pus escaped; several small flat sequestra also came away, these were necrosed portions of the compact tissue. About half an inch below the epiphyseal line was an opening about a quarter of an inch in diameter which led directly into the cancellous tissue of the bone. A sharp spoon was introduced through the opening and the whole of that which would correspond to the cancellous tissue was found quite soft, fatty, greyish yellow in colour, and when it was scooped out there was practically nothing left but a shell of compact tissue. The opening into this space was enlarged to about the diameter of one inch and packed loosely with iodoform gauze; the wound was plugged all round with cyanide gauze, the edges of the upper end being brought together by two or three stitches. Mr. Beale said that this case was one of a kind with which he was quite familiar, but which he admitted he did not at all understand. As regards previous history, there was as a rule nothing of any importance although there was occasionally a history of some injury to the duct. The first symptoms were those of an acute abscess deep in the popliteal space, which burst through the skin within two or three days; there were never symptoms such as were seen with acute periostitis or osteomyelitis; what generally happened to these cases was as follows: The surgeon would probe the sinus and detect bare bone, he then would enlarge the sinus and scrape the surface of the bone with a sharp spoon, then stuff the wound; this was never successful; the procedures in some cases would have to be repeated many times; afterwards the patient would be found suddenly to have an abscess within the knee-joint, the joint becoming completely disorganised and an amputation through the middle of the femur having to be performed. When such a specimen was examined the conditions of the lower end of the femur was found to be such as described in the case on which he had just operated, but an aperture would be found leading into the knee-joint through the inter-condylar notch. He stated that a similar case under his care had been described in *Operating Theatres* on August 2nd, 1899; this case was complicated by rupture of the popliteal vessels, the latter having become quite rotten by the continual passage of pus close to them; since then he had come across seven or eight cases of the same kind, and he was quite certain that the right treatment was a vertical incision down the centre of the popliteal space, removing the compact bone tissue at the back of the lower end of the femur, and scraping out the remains of the cancellous tissue. The disease, he pointed out, certainly did not start at the epiphyseal line and all the evidence went to show that it originated in the cancellous tissue at the lower end of the femur; there was no evidence that the affection was a tuberculous one and in each case he had treated in the manner above described the wound had completely healed up, though of course the process of healing was a slow one occupying some months.

VICTORIA HOSPITAL FOR CHILDREN.

HAIRPIN IN THE BLADDER WITH SECONDARY CALCULUS.—Mr. J. CUNNING operated on a female child, æt. 5, who had been admitted suffering from frequency of, and pain on, micturition. These symptoms were known to have existed six weeks. On admission, she was examined bimanually, and also with the sound, and a stone was discovered in the bladder. It was decided, therefore, to perform the operation of lithotripsy, but the patient was prepared also for the supra-pubic operation in the event of lithotripsy proving to be impossible. The bladder was washed out with boracic lotion, but it was impossible to introduce more than an ounce and a quarter of fluid as the viscous would not retain more; it was then thought that there was something abnormal about the case. When the lithotrite was introduced, some difficulty was experienced in grasping the stone, and when this was effected it was felt that the calculus did not move freely; for this reason it was thought unsafe to proceed with crushing, so the bladder was opened supra-pubically. On the finger being introduced a large stone was discovered, which was felt to be fixed in the bladder like an ordinary encysted calculus. To get this calculus out it was found necessary to place a finger of left hand in the rectum, in order to push the stone up, so that it might be enucleated. As Mr. Cunning got the stone loose he was astonished to find a three and a half inch hairpin imbedded in it; the hairpin was lying transversely in the bladder, but was easily extracted. The calculus, which measured one inch and a quarter by three quarters of an inch, was phosphatic. The bladder was washed out and a drainage tube left in the supra-pubic opening. Mr. Cunning said that it was remarkable that a child of such tender years should have a foreign body in the bladder; there was no history as to how it had been introduced. The child herself knew nothing about it and her parents were both dead. It was possible and most likely that the child had experienced irritation about the genitals and had been scratching with a hairpin, which had suddenly disappeared. This had in all likelihood happened, he thought, at least six months before he had seen the case. It was interesting to note, he considered, how easily a stone could be felt in a child's bladder by bimanual examination, of course, in both sexes, a finger being in the rectum. He pointed out that if any difficulty was experienced in the free rotation of a stone when caught by the lithotrite (especially in such a small bladder as that of a child) it was wise to perform at once a supra-pubic operation. He would invariably, he asserted, try lithotripsy first in any child, providing the stone were small and not a hard oxalic calculus, because in three or four days after that operation the patient was able to get about, and felt no effects from the manipulations, whilst after supra-pubic lithotomy the child would be confined to bed for at least a fortnight, with, in addition, the discomforts of supra-pubic drainage. He drew attention to the high reflection of the peritoneum on the bladder of a child, therefore the surgeon in operating did not in most cases even see the peritoneum. The extraction of the stone was much facilitated, he remarked, by the introduction of a finger into the rectum, whereby the calculus was pushed up; in doing that it was of great importance to wear a glove on the hand, which by that means, when the covering was removed, was perfectly aseptic to go on with the remainder of the operation.

It was satisfactory to note that the child was up in ten days; the wound was healed, and she was able to hold her water for between three and four hours at a time.

TRANSACTIONS OF SOCIETIES.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

SECTION OF SURGERY.

MEETING HELD FRIDAY, MAY 11TH, 1906.
The PRESIDENT, Sir Arthur Chance, P.R.C.S.I., in the Chair.

ENUCLEATION OF THE PROSTATE.

SIR WILLIAM THOMSON read a paper on a further series of the above. He described the more important of eighteen cases, and discussed various points of interest which had been noticed. One of the specimens shown weighed six and a quarter ounces, and one ten ounces, less a few grains. He described the after treatment of the cases and management of various complications, and discussed continuous severe hæmorrhage from the prostate. For that he had carried out enucleation with success. He believed that was the first time that the operation had been reported as undertaken for hæmorrhage only, and he maintained that it was the proper treatment where all other means failed.

SIR THORNLEY STOKER expressed himself in doubt as to the accuracy of statistics concerning the mortality resulting from operation for prostatic enlargement. The time required for prostatic enucleation, in his experience, varied. He had enucleated a large prostatic growth in two minutes, but in another case in which the growth was small the enucleation took half an hour. He recommended benzoate of sodium as a useful drug for promoting acidity of the urine. He considered the Trendelenberg position attended by danger in the case of aged patients.

SIR ARTHUR CHANCE favoured operative measures directed towards the relief of patients suffering from the effects of senile prostatic enlargement. He had found large prostates easy to deal with, and he had frequently noticed that small prostates gave the most intra-thoracic complications. He regarded the Trendelenberg position of great assistance, and he had not found it attended by any obvious risk.

SIR WILLIAM THOMSON, in replying, stated that there was no direct relationship between the degree of prostatic enlargement and the intensity of the symptoms. He alluded to cases of death following suddenly after operation, and which were due evidently to embolism. With regard to washing out the bladder, he usually did so through the urethra forty-eight hours after the enucleation.

MR. L. A. GUNN read a note on Bladder Tumours, and illustrated his remarks with the aid of a series of lantern slides.

BRITISH LARYNGOLOGICAL, RHINOLOGICAL AND OTOLOGICAL ASSOCIATION.

GENERAL MEETING HELD (Rooms of the Medical Society of London) ON FRIDAY, MAY 11TH, 1906.
The President, Dr. Woods, in the Chair.

MR. STUART-LOW exhibited a case of
CLEFT PALATE,

in which adenoids diminished the dyslalia. He remarked that, as so much that was harmful had been attributed to the presence of adenoids, it would sound almost paradoxical to speak of any advantages to be gained by their existence. This case illustrated the fact well, however, that but for the adenoids the defects of speech would have been more pronounced. With such a large palatal deficiency it was very remarkable that articulation was not more imperfect. The practical point he wished to emphasise was that in

cases of defective palate adenoids should not be removed, as the result would be to render the dyslalia more marked. Therefore in operative cases the adenoids should not be removed until the palate operation was completed.

DR. DUNDAS GRANT agreed with Mr. Stuart-Low that the adenoids should remain until after the palate operation.

MR. MAYO COLLIER expressed surprise that the palate had not already been operated on.

The PRESIDENT was in favour of leaving the adenoids until after the palate had been repaired. He was also of the opinion that the operation for cleft palate should remain with the specialist and not be handed over to the general surgeon.

DR. ANDREW WYLIE showed a case of

LYMPHANGITIS OF THE UPPER LIP

in a female patient, æt. 22, who had come to his clinic at the Central London Throat, Nose and Ear Hospital. She complained that the lip had been swollen for the last five and a half years, sometimes being so large as to touch the tip of the nose. Three years ago interstitial keratitis gradually appeared in both eyes. He brought forward this case because, while acute lymphangitis of the lip, due to some local irritation, is common, congenital lymphangitis of lip, called macrocheilia, is not uncommon; chronic hypertrophy lasting 5½ years is rare.

MR. DENNIS VINRACE wondered if vaccination three years ago had modified the course of the disease.

MR. H. BARWELL did not consider that vaccination had anything to do with it.

MR. MAYO COLLIER showed a case of nævus of cheek.

DR. KELSON showed a case of laryngeal disease in a school-mistress, æt. 36, who had suffered from loss of voice for four months. The ventricular bands were swollen, the vocal cords thickened, and the intratonsils swollen.

DR. DUNDAS GRANT considered the case to be more likely inflammatory than tuberculous.

MR. HAROLD BARWELL considered the case to be one of chronic laryngitis due to nasal obstruction and over-strain of the voice in a dusty atmosphere.

The PRESIDENT thought examination of the sputum would help the diagnosis.

NASAL GUARDS FOR RESECTION OPERATION.

DR. WYLIE exhibited some nasal guards for resection operations which he had designed. For deviations of the septum causing obstruction, the simple removal of the obstruction and leaving a large perforation of the septum was nearly obsolete except in exceptional cases. Many operations, as Asch's Meursissette, have been devised, but he considered the submucous resection operation introduced by Killian was the most successful. From an experience of a considerable number of cases he was of opinion that this operation could be more easily performed without the speculum, the chief difficulty being to use instruments through the speculum. Freer and others had dispensed with the use of the speculum but introduced nothing to preserve the mucous membrane from injury during the operation. The guard exhibited was inserted between the cartilage of the septum and the mucous membrane on the concave side where one blade of the septum was usually inserted. The surgeon held the guard in position himself; his assistant retracting the nares, etc., also the mucous membrane on the convex side, by means of a retractor similar to Freer's, but made of copper to be easily bent. With the guard on the concave side and the nares well opened by the retractor, the surgeon could dispense with the speculum, and with comfort cut away the deflected cartilage by means of modified Killian knives (one for each side); or, if the septum was thin, by means of Killian's plough or Ballenger's ingenious swivel knife. The guard if held properly protected the mucous membrane. If the deviation extended to the vomer, strong

forceps, as Jansen-Middleton's, and also Killian's gauge could be more easily manipulated in that way. The

guards were made in three sizes by Mayer and Metzler, 71, Great Portland Street, London. The blades or nasal ends were made of copper, so that they could be easily bent to suit any deviation; the handles were firm and solid.

LARYNGOLOGICAL SOCIETY OF LONDON.

At the last meeting of this Society Mr. Charters Symonds, F.R.C.S., President, occupied the chair.

THE ORAL INFECTION OF SYPHILIS.

Dr. H. J. Davis exhibited three patients, members of one family, who were all the subjects of syphilis, communicated by oral infection from one to the other. The first to develop syphilis was a child, æt. 11 (there was no evidence of genital infection), first seen on account of a dusky, macular eruption on the arms, the legs and the body, tonsillitis, severe adenitis, with enlarged glands in neck and groin; there was no appearance of a primary sore. The child's grandmother æt. 60, a widow for fourteen years, nursed and slept with the child during her illness. She became ill with tonsillitis, adenitis, and a typical rash and early iritis. There was no evidence in her case of any primary sore. The third member of the family was the child's aunt, who was inhabiting the same flat as the child and her grandmother, and developed a chancre inside the right nostril. When exhibited the patient presented mucous patches on the tonsils, early roseola, and the primary sore could be seen at the junction of the skin and mucous membrane of the right nostril.

Dr. D. R. PATERSON exhibited a fish-hook removed from the œsophagus and also a tooth-plate, which had been swallowed during sleep and had become lodged opposite the supra-sternal notch. Dr. Paterson also showed a skiagram of the neck in a case where a piece of meat was impacted in a stricture of the gullet. The cases illustrated how such foreign bodies could be removed with instruments of precision, and also the necessity for discouraging the indiscriminate use of coin-catchers and probangs. Dr. Paterson also exhibited

a case of left-recurrent paralysis and paralysis of the soft palate, associated with middle ear disease and facial palsy on the same side.

Dr. H. PEGLER exhibited a patient with bilateral ulceration of the posterior segments of the vocal cords. The opinions expressed were in favour of it being a case of pachydermia laryngis.

Dr. HERBERT TILLEY exhibited four cases of chronic frontal empyæmata operated on by a simplified Killian operation.

Mr. CLAYTON FOX showed a case of tuberculosis of the soft palate, the pharynx and the epiglottis.

Cases were also shown by Mr. Charles Parker and Dr. Dundas Grant.

GENERAL MEDICAL COUNCIL.

SIXTH DAY.—MONDAY, MAY 28TH, 1906.

Dr. MACALISTER, President, in the Chair.

A MOTION by Dr. FINLAY: "That the Council sit to-day till the business in the Programme has been concluded" was lost.

A question (notice of which had been given) was asked by Mr. Brown: "To call attention to the scheme adopted by the British Medical Association in regard to the nomination and election of Direct Representatives to the Council, and to ask the President whether the pledge exacted by the Association is not calculated to encroach on the privileges of the Council."

A notice was next brought forward by Mr. Brown, seconded by Mr. Jackson: "That the following notice of motion be referred to the Education Committee for consideration, and report to the Council: 'That a period of pupillage of not less than twelve months with a registered medical practitioner officially recognised for the purpose by one of the Licensing Bodies should be regarded as equivalent to a period of six months of the ordinary medical curriculum.'" The motion was lost.

The Council elected an Executive Committee and a Penal Cases Committee. The Council then received the following communication referred to the Council by the Executive Committee in regard to a Draft Bill promoted by the Society of Apothecaries of London.

(a).

"17, Wimpole Street,
"Cavendish Square, W.
"March 30th, 1906.

"Dear Sir,—The Society of Apothecaries desire to bring the draft of a Bill for amending the title of L.S.A. to the notice of the Medical Council, and for the expression of their opinion should such be their desire.

"I am, yours truly,

"To the Registrar. HUGH R. BEEVOR."

(b).

"An Act to vary the diploma or title of Licentiates of the Society of Apothecaries of London.—Whereas since the 30th day of June, 1887, every person applying to the Society of Apothecaries of London for its licence to practise as an apothecary has been required to pass a qualifying examination in medicine, surgery, and midwifery duly held by the said Society of Apothecaries with the assistance of examiners appointed by the General Council of Medical Education and Registration of the United Kingdom (hereinafter referred to as the General Council) in accordance with the provisions of the Medical Act, 1886, which came into operation on the date aforesaid. And whereas the diploma or title of 'Licentiate of the Society of Apothecaries, London,' has heretofore been inserted in the Register kept under the Medical Acts (hereinafter referred to as the Medical Register) as the qualification of a registered medical practitioner holding the said licence of the said Society of Apothecaries. And whereas it is desirable that the terms of the diploma or title granted by the said Society of Apothecaries to its Licentiates who have passed such qualifying

examination as aforesaid shall clearly indicate that it is a qualification in both medicine and surgery. Be it therefore enacted, &c. :—This Act may be cited as the 'Apothecaries Act, 1906.' It shall be lawful for the said Society of Apothecaries to grant to every person who has since the 30th day of June, 1887, passed or shall hereafter pass a qualifying examination in medicine, surgery, and midwifery duly held by the said Society of Apothecaries in combination with another medical corporation or a university or with the assistance of examiners appointed by the General Council, in accordance with the requirements of the Medical Act, 1886, the diploma or title of 'Licentiate in Medicine and Surgery of the Society of Apothecaries, London.' The said diploma or title of 'Licentiate in Medicine and Surgery of the Society of Apothecaries, London,' shall be deemed to be added to the qualifications in Schedule (A) to the Medical Act, 1858, and every person possessed of such diploma or title shall be entitled to have the same entered in the Medical Register as his or her qualification or additional qualification for registration under the Medical Acts."

Proposed by Sir HUGH BEEVOR, seconded by Sir THOMAS MYLES, and agreed to, that the communication be entered on the Minutes.

A motion by Sir HUGH BEEVOR, seconded by Sir THOMAS MYLES: "That this Council has no objection to the statutory definition (*i.e.*, in an Act of Parliament) of the registrable title L.S.A. whereby 'surgery' as well as 'medicine' shall be connoted," was carried.

The Council proceeded with the adjourned consideration, postponed from December 1st, 1905, of the proposed Standing Orders relating to the Visitation and Inspection of Qualifying Examinations.

The Standing Orders as revised by the Executive Committee and submitted to the Council on December 1st, 1905, were as follow:—

VISITATION AND INSPECTION OF QUALIFYING EXAMINATIONS.

(1) The qualifying examinations of the several licensing bodies in the three divisions of the Kingdom shall be visited and inspected on behalf of the Council from time to time as the Council shall direct.

(2) The visitations shall be conducted by one or more members of the Council deputed as visitors for that purpose; the inspections by one or more Inspectors appointed by the Council, but not members thereof.

(3) The cycle of visitations and inspections shall ordinarily extend over three years. Within each of the three years the universities of one division of the kingdom and the Licensing Corporations of another division of the kingdom shall be visited and inspected.

(4) The visitor or visitors shall be appointed by the Council at the May Session in each year for the ensuing calendar year; and visitors belonging to one division of the kingdom shall be deputed to visit examinations held in another division. Should a visitor so appointed be unable to act, or should no appointment have been made in time for a particular examination, the Executive Committee, or in case of emergency the President, shall appoint a visitor for that turn. All appointments so made shall be reported to the Council at the Session next following.

(5) One or more inspectors shall be appointed for the cycle of inspections and for all three divisions of the kingdom. An inspector shall not, during his tenure of office, act as examiner in any qualifying examination.

(6) A visitor shall receive no remuneration, but shall be paid his travelling and hotel expenses.

(7) The remuneration of an inspector shall be at the rate of two hundred pounds per annum, in addition to his travelling and hotel expenses.

(8) A list of the examinations to be visited and inspected in the ensuing year, with their respective dates, shall be drawn up and circulated among members of the Council before or during the May Session, with a request that members will intimate to the President which examination or examinations they are willing to visit.

(9) The President shall give to each visitor and inspector a formal commission in writing under the seal of the Council.

(10) It shall be the duty of inspectors to report to the Council their opinion as to the sufficiency or insufficiency of each examination attended by them. Their reports shall set forth in order all necessary particulars as to the questions proposed in the written, oral, and practical parts of the examination, the cases and the appliances provided for clinical examinations, the arrangements made for invigilation, the method and scale of marking, the standard of knowledge shown by successful candidates, and generally all such details as may be required for adjudicating on the scope and character of the examination.

It shall be the duty of visitors to report, separately from the inspectors, on each examination visited by them, and they shall include in their report such particulars and observations thereon as they deem important for the information of the Council.

(11) Visitors and inspectors shall include in their reports, in the form of a brief diary, a statement of the days and hours at which they were respectively present during the course of the examination, and of the parts or divisions of the examination in progress on each day.

(12) Visitors and inspectors shall be made acquainted with such previous reports on the examinations attended as the Executive Committee or the President may direct, together with the remarks and observations of the licensing bodies and the reports of the Examination Committee thereupon. They shall also be provided with copies of the recommendations of the Council in regard to professional examination, and shall include in their reports a statement of the extent to which these recommendations have been carried out in the case of each examination attended.

(13) The reports of visitors and inspectors when prepared shall be forwarded to the President, who shall cause them to be printed. The final proof copies of the reports, as corrected, shall be signed in writing by the visitors or inspectors, as the case may be, and shall be preserved by the General Registrar as the authoritative copies.

(14) Previous to the meeting of the Council at which the reports of visitors or inspectors are to be considered, confidential copies, not exceeding 50 in number, of each report shall be forwarded for consideration to the Licensing Body to which such report refers, with a request that the body will make such remarks and observations thereon as may be thought necessary, and will forward the same with as little delay as possible to the General Registrar.

(15) A confidential copy of each report of the visitors or inspectors, together with the remarks and observations made thereon by the Licensing Body concerned, shall be supplied, when ready, to each member of the Council.

(6) The Examination Committee shall consider and report to the Council on each report of the visitors and inspectors, and shall also, at the end of the cycle of visitations and inspections, present to the Council a general report on the results and conclusions arrived at.

[A motion by Dr. McVAIL, seconded by Dr. Bruce, to have the discussion on his amendments *in camera* was lost.]

In the discussion which followed Dr. McVail's amendments, the principal points referred to were: Complete separation between visitation and inspection. Inspections not to be intermittent. The inspectors should not be underpaid. They should be paid according to the work done. Should the reports be confidential, that is to say, only for the General Medical Council and the Privy Council? Is visitation merely the right of access to examinations by any member of the General Medical Council, or are visitors commissioned by the General Medical Council?—

The following proposed Standing Orders relating to

inspections and visitations of qualifying examinations were submitted by Dr. McVail:—

(1) The Medical Council shall, as required by sub-section (2) and Section 3 of the Medical Act, 1886, appoint inspectors to attend at all or any of the qualifying examinations held by the bodies which, under the divisions (a), (b), or (c) in Sub-section (1) of Section 1 of the Medical Act, are entitled to hold such examinations (the subjects of examinations were defined in a resolution of the General Medical Council of June 6th, 1890).

(2) Generally the inspectors shall be instructed by the President to give special attention to (ix), (x), and (xi) of the Council's enumeration of the subjects of professional examination, and "to report to the General Council their opinion as to the sufficiency or insufficiency of every examination which they attend, and any other matters in relation to such examination which the General Council may require them to report."

(3) It shall be the duty of the Examination Committee of the Medical Council to advise the Council as to where and when inspections should take place, and as to the subjects other than (ix), (x), and (xi), which may at any time require special inspection.

(4) The Examination Committee shall also advise the Council as to where and when Visitation of Examinations by members of the Council or other persons appointed by the Council under Section XVIII. of the Medical Act of 1858 should take place, and as to the subjects of these examinations to which visitors should give particular attention. The visitors shall report in writing to the Medical Council.

(5) The remuneration of an inspector shall be according to the work done by him on a scale of payment to be determined by the Medical Council with the sanction of the Privy Council as required by Sub-section (4) of Section 3 of the Medical Act, 1886, and visitors who are not members of the Council shall be paid on this scale.

(6) Members of Council acting as visitors shall receive only travelling and hotel expenses.

(7) The Medical Council, on receiving a report from the inspectors on a qualifying examination, shall forward a copy of such report "to the Body or to each of the Bodies which held the examination in respect of which the said report was made, and shall also forward a copy of such report, together with any observations thereon made by the said body or bodies to the Privy Council," as required by Sub-section (3) of Section 3 of the Medical Act, 1886.

(8) The reports of the inspectors and the remarks by the bodies inspected shall be regarded as confidential documents for the information of the General Medical Council and the Privy Council, and shall not be published by the Council in the public Minutes.

The following amendments on the Standing Orders as submitted by the Executive Committee were proposed by Dr. FINLAY, and seconded by Sir V. HORSLEY (notice having been given):—

I.—"That all references to visitations and visitors be struck out of Chap. XXIII. of the Standing Orders, as revised, in order that these matters may be dealt with separately by the Council."

II.—On Standing Order (5) "That instead of the words 'one or more inspectors' the following be substituted: 'Three Inspectors, one for medicine, one for surgery, and one for midwifery.'"

III.—On Standing Order (7) "That instead of the words 'two (hundred)' the word 'one' be substituted. No. I. was carried.

Nos. II. and III. were referred to the Examination Committee.

The following motion was then brought forward by Sir V. HORSLEY, seconded by Dr. BRUCE, "That the Executive Committee be instructed to approach the Privy Council and to secure such alteration in the Regulations 8 and 10 of the Schedule of Instructions to Voters under Section 8 of the Medical Act, 1886, as will provide for the adoption of the principles of

voting by ballot in lieu of the existing system of election of Direct Representatives."—After a discussion this was carried.

Sir JOHN WILLIAMS, seconded by Mr. JACKSON, presented a report from the Students' Practical Midwifery Committee. This was received, approved and entered on the Minutes.—On the proposition of Sir JOHN WILLIAMS, seconded by Dr. NORMAN MOORE, it was resolved that this report be sent to the Licensing Bodies.

The report of the Education Committee, proposed by Dr. MACKAY, and seconded by Dr. NORMAN MOORE, was received, approved, and entered on the Minutes.

The Public Health Committee reported that as no business had come before them they had no report to make to the Council.

The report of the Finance Committee brought forward by Dr. Pye-Smith, seconded by Mr. TOMES, was received, adopted, and entered on the Minutes.

The report of the Students' Registration Committee brought forward by Sir Hugh Beavor, seconded by Sir J. BATTY TUKE, was received, approved and entered on the Minutes.

A motion was brought forward by Mr. BROWN, seconded by Sir VICTOR HORSLEY, "That representations be made to the Privy Council that the time has arrived when the number of Direct Representatives for England, Scotland, and Ireland should be increased to the maximum number permitted by the Medical Act of 1886." This motion met with but little support from the Representatives of Corporations and Universities. Sir JOHN BATTY TUKE, however, said he was in support of the motion, for he did not object to an increase of *Direct* Representatives, though he thought that Representatives elected under a scheme such as that of the B.M.A. would be indirect and not direct, Representatives.

An amendment proposed by Dr. SAUNDBY, seconded by Sir THOMAS MYLES: "That the increase should only be of one member for England" was lost. 14 against, 7 for, 9 did not vote, 4 absent, and the original motion on being put was lost—15 against, 6 for, 8 did not vote, 5 absent.

A Dental Registration and Examination Committee and a Students' Registration Committee were elected.

Mr. Allen was re-elected Registrar.

A vote of thanks to the President was proposed by Dr. NORMAN MOORE, seconded by Dr. LINDSAY STEVEN, and carried by acclamation.

Paris, June 3rd, 1906.

HOT WATER IN SURGERY.

PROF. RECLUS makes an extensive application of hot water in his surgical practice and numerous are the cases which benefit from its employment. Its efficacy and the reasons of its almost universal action, he says, are explained by the fact that morbid phenomena have frequently at their basis inflammation of the tissues and it is against this element common to so many local affections that heat exercises its influence. It actuates the circulation, facilitates the cellular exchanges, removes waste and infiltration from the organs and favours diapedesis and phagocytosis.

By hot water he means water at the temperature of 122° to 131° F. Less than 122° the effect is not so energetic, while more than 137° would be ill-supported by many patients, especially in such regions as the hand, face and genital organs. A thermometer should be always used to graduate the temperature. Of the many uses M. Reclus finds for hot water may be mentioned the disinfection of wounds caused by accidents. It possesses the triple advantage of being slightly antiseptic, of being an excellent hemostatic, and of warming the patient rendered cold and rigid by the traumatic shock.

A strong jet should be directed on the tissues, so

as to penetrate all portions of the wound and thoroughly clean out all blood clots, foreign bodies, &c.

In the treatment of sprain, hot water is of the utmost value. The affected point is plunged not into cold water as was recommended in the middle of last century, but into hot water twice a day for ten or fifteen minutes; after which massage is applied for a similar period of time, and finally an elastic bandage surrounds the parts, producing gentle pressure.

Certain visceral inflammations, such as perimetrosalpingitis in woman and inflammation of the prostate in man, are greatly benefited by the use of hot water as enemas. In the former cases the patients frequently affirm that they have been in the habit of using injections of hot water for a long time without success. But, as Reclus remarks, it is generally found that the temperature of the water does not exceed 104° , which is entirely insufficient, and in any case it should be given as enema and not as injection.

To pretend to influence the uterus and its neighbouring organs by vaginal injections is what he calls an anatomical error. By vaginal injections, the hot water only attains the os and beyond the question of cleanliness its action is nil. By enemas on the contrary, the liquid is only separated from the uterus, ligaments and ovaries by the thickness of the cul de sac of Douglas.

The enema should be administered every morning half an hour before rising, if, naturally, the condition of the patient did not require to rest in bed. The water should be allowed to enter slowly into the rectum so as to avoid any premature muscular contraction. Some patients find it painful, and difficult to retain the enema as the temperature of 122° or 131° seems to them to be unbearable. In any case they should be encouraged, in view of the excellent results obtained, to endure a little suffering if need be. M. Reclus published recently a series of cases of salpingitis where extirpation was judged indispensable by some of the best gynaecologists, and which by simple rest and enemas of water at 122° to 130° got completely well.

The best treatment for inflamed prostate is enemas of hot water, renewed three or four times a day. The effect is most surprising, the swelling, pain, dysuria and retention of urine, disappear with extraordinary rapidity.

The same may be said in the treatment of chronic cystitis from hypertrophy of the prostate. The congestion of the organs diminishes and the morbid phenomena are relieved or disappear.

These enemas are also recommended against hæmorrhoids, which they relieve and when an operation is not accepted (dilatation or excision) they frequently cure, if only temporarily.

In superficial inflammations, as boils, anthrax, erysipelas, whitlows, &c., hot water is an excellent application. A compress folded several times is immersed in water at the desired temperature and applied to the inflamed part. At the end of a few seconds it has got cold and has to be renewed, and so on for ten or fifteen minutes several times a day.

It is not only acute inflammation that is benefited by applications of hot water, it influences also the chronic form and modifies the surface of sores of no tendency to heal. For a long time back Prof. Reclus used hot water in treatment of ulcers; it stimulated the sore and in a short time signs of healthy granulation was observed. In Switzerland this method is largely used.

GERMANY.

Berlin, June 3rd, 1906.

At the Congress for Innere Medizin, Hr. Kraus, Berlin, spoke on

THE PATHOLOGY OF THE THYROID GLAND.

He said a secretion within the gland had been proved. Blum's theory of intoxication by intra-glandular iodization was still hypothetical. The thyroid gland of the adult animal must have a specific power of selection

and to it must be ascribed a chief *role* in the dissemination of iodine in the fluid masses. It was remarkable that iodine first appeared during extra-uterine life, and then slowly entered the infantile organism. The quantity of iodine in the thyroid was subject to certain oscillation both under normal and abnormal conditions. An explanation of the function of the gland based exclusively on its iodine constituents was not possible. The disease of thyreoaplusia that never exhibited localised or general convulsions or pareses rendered possible a preliminary separation of the functions of the thyroid and the parathyroid glands. The question of relation between tetania strumipriva and human epithelial granules was, from the experience of operators, probable. As effects of the whole, thyroid fluid had proved injurious to the heart, and lowered blood pressure as well as a marked acceleration of the pulse, at least in certain animals—the dog, for instance—might be taken for granted. Many facts were in favour of the assumption of a regulatory power over the heart. He could not accept the assumption that the goitre heart was simply to be looked upon as a form of Basedow's disease. The Basedow problem could not be cleared up by a prolonged discussion of the relations of the syndrom to the thyroid on one certain point alone. All the clinical symptoms fitted much better than formerly into the nosological system that was based on hypofunction of the thyroid gland. The therapeutics of thyroid gland diseases remained very hopeful.

Hr. Kocher, Bern, said that treatment with thyroid gland preparations, only had an effect so long as they were being used; the symptoms returned when they were left off. The causes of tetany and cachexia must be different. In Basedow's disease we have to do with a hyperthyreosis. His conclusions were we could accurately distinguish two groups of disease dependent on changes in the thyroid apparatus and separate them sharply from each other in the thyreoprive and the thyreotoxic diseases. The thyreoprive diseases were consequences of total or partial loss of function of the thyroid gland. A distinction must be drawn between loss of the thyroid proper with its special train of symptoms and the loss of the parathyroid in its acute or chronic form in the shape of intoxication appearing as tetania parathyreopriva. Together they formed the large group of hypothyreoses of which myxœdema and cretinism were examples. But much more were the thyreoprive equivalent to be considered in which individual symptoms stood in the foreground, such as thyreoprive disturbances of growth, the thyreoprive disturbances of the sexual function, thyreoprive psychoses and neuroses. In all grades and forms of this group the thyroid preparations, and within certain limits iodothyrene, were a sovereign remedy, in so far as all symptoms that could improve did so, so long as proper doses were made use of; their action was, however, purely palliative. The radical remedy was the implantation of healthy thyroid gland. The thyreotoxic diseases were consequences of increased activity of the changed thyroid gland. They ran on acute or a chronic course, the first under the form of an intoxication, the latter more approaching to disease of tissue change. Further investigation must decide how far these groups must be classed under the title hyperthyreoses, how far a dysthyreosis is mixed up with them. Here also treatment was certain when the physician had recognised the commencing stages, the milder form and the hyperthyreotic equivalents amongst which the "Kraus" heart and certain psychoses stood in the foreground. The remedy here was anything that limited the activity of the thyroid gland. Before all ranked the exclusion of all physiological irritations by bodily and mental rest. Connected with this was the nutrition in which a substitute for exaggerated decomposition of albumen must be allowed for, but avoiding all that excited the thyroid gland. Here milk was in place and perhaps especially thyreoprive goats' milk and milk powder, and above all phosphates. The radical treatment was operation by

ligature and excision according to the degree of the hyperplasia.

Hr. Neusser, Vienna, said there must be a very close relationship that was not yet explained between the activity of the thyroid gland and that of the liver.

Hr. F. Müller pointed out how easily tired patients suffering from Basedow's disease were. There was a pseudochlorosis with normal blood, cardiac symptoms with changes in the thyroid, a relationship between Basedow's disease and diabetes. The differentiation of Basedow struma from other strumas was possible.

Hr. Hœnnicke, Greifswald, could produce exophthalmus in animals. He looked upon granulative changes in the secretion as the cause of Basedow's disease.

Hr. Erdheim reported some fatal cases of tetanus.

H. Pfaundle in obduction in cases of congenital myxœdema had met with complete absence of the thyroid gland and also of the parathyroid; this was evidence against the news of Kraus and Kocher.

H. F. Schultze would keep up medicinal treatment for a year and then operate.

Hr. Blum, Frankfurt, adopted the standpoint that the thyroid gland was not a secreting organ, but that it seized upon poisons circulating in the body and rendered them non-poisonous, that it was a protecting organ, principally of the nervous system. There was a special iodine splitting power and property in the thyroid gland. In Basedow's disease he advised a diet free from fleshmeat, and bromini-albumen, 2 to 3 grammes daily.

Hr. Gilmer had had good results in treating Basedow's disease with X-rays.

AUSTRIA.

Vienna, June 3rd, 1906.

BASEDOWI OR SCLERODERMA.

SINGER presented a peculiar case of Basedowii which he considered to be more closely allied in its clinical and histological characters to scleroderma.

For twelve years past the patient had observed a swelling on the neck gradually increasing up to the eyes and down over the breast. The object that brought the patient to hospital was the swelling on the neck itself, which appears to have increased more rapidly within the last year and a half, and was now interfering with the freedom of breathing which was now resembling stridor. The intumescence certainly depended upon a swelling or enlargement of the right side of the thyroid gland. In addition to this hypertrophy there were also tracheal stenosis, slight exophthalmia, Stellwag's symptoms, insufficient convergence, slight tremor in hands, alimentary glycosuria and pulse acceleration. This testimony is strong proof of morbus Basedowii, but the cutaneous thickening on the breast and face is indicative of a primary change which seems to have preceded the glandular hypertrophy. The patient affirms that the commencement of her trouble was preceded by a large, soft swelling, which subsequently became as hard as stone, brown on the surface which involved the whole of the right mamma and the greater part of the left. It also extended over the trunk, and particularly to the space between the shoulder behind, where it had a livid hue with hard plaques at the margin of the morbid and healthy skin. Half a year ago a large, soft doughy swelling commenced on the left arm resulting in the same changes.

Singer thought this was an uncommon form of scleroderma involving the upper part of the trunk.

In the discussion that followed several of the members concurred in the opinion that the affection was one of carcinoma—primary in the mamma, and by metastasis was carried to the second breast, thyroid, axillary lymphatics, and finally to the skin by closing the lymphatic ducts and producing œdema.

RESECTION AND PROTHESIS OF LOWER JAW.

Pichler next exhibited two cases on whom he had operated for cancer of lower jaw. The first was æt. 64, who had an epithelium in floor of the mouth which

destroyed a large area of the lower jaw. The tumour was removed in January with the submaxillary glands. The jaw was sawn behind the second molar on the left side and behind the incisor on the right. The intervening portion of jaw was entirely removed and a tin model inserted with lead bindings to the remaining jaw, at both ends of the fitting to admit of the model being removed at any time to examine the wound. This immediate prosthesis was only temporary to hold the parts in place till the healing process was complete. Four weeks after this a complete model was inserted with an alveola for the insertion of teeth fitted with a hard gummy connection to the gum, and fixed with gold clamps in which are enclosed india-rubber connections to prevent movement or jar in the fitting. The teeth can finally be fitted into the alveola by the assistance of screws, which enable the patient to masticate his food as hitherto. This prosthesis has the great advantage of retaining the natural form and outline of the face.

The second case was a female, æt. 28, who had been similarly operated on for a giant-celled sarcoma of lower jaw.

NEOPLASM IN BOWEL.

Lorenz recorded the case of a female, æt. 48, on whom he had operated for carcinoma of the bowel at the coccum, around which were small metastatic tumours binding the whole mass together. It was found that 290 centimetres of the small intestine with a portion of the large intestine must be removed to prolong life. After a few complications, the recovery was complete. Fourteen days after leaving her bed, she was dismissed with a voracious appetite. After returning home to the country, she rapidly increased in weight and now looks strong and robust. The stools are of a semi-fluid or soft consistence.

HUNGARY.

Budapest June 3rd, 1906.

At the last meeting of the Budapest Inter-Hospital Association, Dr. Rottenbiller read a dissertation on

THE PROTECTIVE ROLE OF THE OMENTUM, of which the following is an epitome:—

It is only within the last few years that the importance of the omentum has come to be recognised. Its function has, however, never been thoroughly investigated. The animal experiments of two German physicians, Drs. Renzi and Boeri, were the first of this kind. The author, too, investigated the function of the omentum with especial reference to other abdominal organs, particularly the spleen. If the main stem of the splenic artery or vein in a dog be tied off, the spleen, after one to two months, still retains its integrity and the circulation is almost undisturbed. It is probable that the omentum sustains the circulation, at least in part, for it is often found lying on the spleen, its vascularity is increased, and in separating the adhesions considerable bleeding is caused. This activity of the omentum in restoring the inhibited circulation affords encouragement for such operations as that of Talma's for a disturbed portal circulation. If the blood supply to the spleen is entirely cut off, the organ becomes necrotic. But, even after several days, the omentum is observed to have surrounded the organ, and in ten days it has formed a dense network around the spleen, in the centre of which lies the organ, encapsulated, diminished in volume, and in a state of disintegration. After twenty days it is no larger than a nut, and enclosed in a fibrous capsule with walls about 2 to 3 mm. thick. In one to two months there is scarcely any trace of the spleen left except a small fibrous nodule, almost complete absorption having evidently taken place. The animals gave no symptoms of this process going on in their interior. If the circulation is entirely cut off and the omentum excised as much as possible, encapsulation does not take place, the spleen becomes necrotic but no absorption follows, and the animal dies within twenty-four to forty-eight hours. If this operation is done in two stages, the vessels being tied off about eight to ten days

after the omentum has been extirpated, death does not come on until three to ten days later. Neither one of these operations alone is fatal, but death is caused when both are done together, and is due, the author believes, to the extraordinary toxic qualities of the disintegration products of the splenic tissue. The absorption of these is more or less hindered by the encapsulation produced by the omentum. It was also determined that the same thing took place when a kidney was tied off, encapsulation by the omentum being followed by slow degeneration and subsequent absorption. Foreign bodies introduced into the peritoneal cavity were likewise surrounded by the omentum, and apparently remained without causing any further trouble. The author believes that these observations not only clear up the question as to what becomes of certain internal organs which may become cut off from their circulatory supply, but also serves to indicate certain therapeutic applications which are rendered possible by what is known of the functions of the omentum from these experiments.

FROM OUR SPECIAL CORRESPONDENTS AT HOME. SCOTLAND.

MEETING OF THE PHYSIOLOGICAL SOCIETY.—A conjoined meeting of the Physiological Society and Edinburgh Pathological Club took place in Edinburgh on June 2nd. A large number of members of the former Society resident in all parts of the country were present. No less than 31 communications were down on the billet, and thanks to excellent organisation and commendable brevity on the part of the speakers it was found possible to carry through all the business within the time allotted. One of the leading features of the meeting was a series of microscopic demonstrations by Dr. Chalmers Watson and a number of co-workers on the effect of an excessive proteid diet on the animal economy, the changes in nutrition, in the thyroid gland, in the kidneys, in the osseous and reproductive systems, and in the teeth being most striking. The animals used in the observations were rats. Papers on pharmacological subjects—the action of Tutin, a toxic glucoside obtained from the footgrass of New Zealand, which is so poisonous to stock, and on the relation between chemical constitution and physiological action—were contributed by Dr. Marshall. Professor Schaefer (in whose laboratories the meeting took place) gave a demonstration of the action of pituitary extract, showing that it raised the blood pressure and had a powerful specific action on the kidneys, causing swelling of the organs and free diuresis—a fact not without interest when considered in connection with the clinical observation that polyuria is not very rare in acromegaly. Dr. Harris read a note on the true relations of Relter's tetanus and other purely physiological papers. An interesting microscopic demonstration was that by Dr. Goodall, showing the stages of hæmatogenesis in the foetal sheep. Papers on Physiological Chemistry were also given by Drs. Noel Paton, Cramer, and Cathcart. Dr. Paton's communication had reference to the carbohydrate metabolism of the foetus. He has demonstrated the presence in foetal tissues and fluids of a levulose, the origin of which is in all probability the maternal placenta. Altogether the meeting was one of great interest, and after the scientific part of the proceedings had been overtaken the members went by train to North Berwick, where a golf match had been arranged, while, through the hospitality of Mrs. Schaefer, those who did not take part in the royal and ancient game were enabled to visit Tantallon Castle and the Bass. In the evening the usual dinner took place. The charming summer weather, so great a contrast to what we have experienced lately, did much to contribute to the success of the gathering.

RETIREMENT OF PROFESSOR MCKENDRICK, Glasgow.—We learn that Prof. McKendrick, who has occupied the chair of Physiology in Glasgow since the year

1876, intends to retire at the close of the ensuing summer session. He will carry with him the good wishes of hundreds of his old students, and the hope of all that he may long enjoy the ease and leisure which 30 years of strenuous work have so well earned. A number of names have been mentioned as prospective applicants for the chair, which is in the gift of the Crown, but until the vacancy is officially announced nobody, of course, can come definitely into the field.

THE INEBRIATES ACTS.—A deputation from the municipalities of the principal Scottish towns waited on the Secretary for Scotland on the 29th ult. to urge the Government to take up a Bill which has been drafted to amend the Inebriates Acts, 1879 to 1900. Mr. Myles, Town Clerk of Glasgow, was the principal speaker. The main contention of the deputation was that the existing acts were in many respects unworkable. The clauses proposed had for their chief objects simplification of procedure; for example, the detention in an inebriate reformatory of an habitual drunkard who has been thrice convicted may be ordered by a Sheriff without a jury, instead of the present cumbersome procedure being required. Clauses containing quite new provisions for dealing with persons who were squandering their means, and bringing their families to destitution through drink, but who had succeeded in keeping out of the hands of the police, and also for getting hold of habitual pauper drunkards and loafers—the class of persons familiarly known to parochial authorities as “ins and outs”—were also proposed. The Secretary for Scotland gave a sympathetic reply to the deputation but pointed out the Parliamentary difficulties in the way of passing their measure. The Lord Advocate, while agreeing with the principle of the Bill, feared that it would be necessary to overhaul all the statutes and pass something in the nature of a consolidating act. It seems thus, as though the proposals have little immediate prospect of receiving legislative sanction, but it is satisfactory to have official assurances that the matter will come under the purview of the Ministry.

BELFAST.

COUNTY DOWN ASYLUM.—The annual report of this institution, just issued by the resident medical superintendent, Dr. Nolan, shows a daily average of 715 patients at an average cost of £23 16s. 5d. This is calculated on the gross expenditure, less repayment of loans. Deducting receipts from paying patients, and other miscellaneous receipts, the net average cost was £22 2s. 4d., as against £22 13s. 5d. in the previous financial year, a saving of 11s. 1d. per head. Reduced by the capitation and Imperial grants the actual cost to the rates was £7 10s. 1d., which shows a net reduction of £1 12s. 2d. per head in two years. The substitution of cocoa for tea at supper saves £150 a year, and the farm has been highly remunerative.

THE HEALTH OF THE CITY.—At the monthly meeting of the Corporation, held last Friday, three deputations appeared with reference to the appointment of a Medical Superintendent Officer of Health. The first was from the Ulster Medical Society, and the same speakers were requested by the society to appear as had already spoken at the Public Health Committee a few days before, Professors Lindsay and Byers. The former said that in the death rate from tuberculosis Belfast stood about fifty years behind the great towns of England, and showed how other cities had dealt with the matter. Professor Byers emphasised the necessity of a skilled and trained man for the post. The other deputations, which were from the Citizens' Association and from the Trades Council, both took the same line as the medical deputation. After the withdrawal of the deputations the Chairman of the Public Health Committee, Dr. King Kerr, made a lengthy reply to their various criticisms, quoting a series of carefully prepared statistics to prove that all is for the best under the best of all possible committees. His child-like satisfaction with his own committee is most touching, but will not do much to restore public confidence in it, when the city is week by week declared by the Registrar

General to have one of the highest death-rates in the United Kingdom. In the end the proposal that a salary of £800 a year should be offered to the new Medical Officer was referred back to the Council in Committee.

LETTERS TO THE EDITOR.

MEDICAL EDUCATION.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR.—At the present time complaints of the apathy of Irish medical men to their collective interest are loudly expressed. An attitude, however, of indifference even though assumed, is better than one of futile opposition to internal vested interests and undignified dissension in presence of them. Until there is union on the basis of a definite policy it is just as well to let things slide.

In the issue of your journal of May 16th "Criticus" comments on an article I contributed (May 9th) to it, and what he says may be thought to require some notice. Whether that article was discursive in the sense Kant, or in that "Criticus" uses, the term may be allowed to pass if only what I say now is not taken as discursive in either sense. Simple propositions are not discursive, but may or may not become matter for discursive treatment in the mind of those entertaining them. "Criticus" gives certain propositions which, no doubt, one may proceed to entertain discursively if allowed as premises, but then they can be allowed as such only after examination. Want of space—not want of courtesy—compels me to meet them, not discursively, but by their simple contradictories.

The immediate occasion on my article was a comment in a preceding article on the Archbishop of Dublin's criticism on the Trinity College Medical School. The Archbishop, like everyone else, has a perfect right to criticise that or any other educational institution, but, as the comment was put, I inferred that his Grace did so with the spirit and purpose of an ecclesiastic, and not of a critic pure and simple. My proposition in reference to this was that Huxley had the task imposed on him of saving the freedom of science from, in particular, the "Oxford Movement" and its far-reaching influence. My critic states that in doing so I am renewing the dead hostilities of an obsolete controversy. The contradictory is that the conflict between ecclesiasticism and science is as much alive as ever it was, and promises, indeed to become more acute than it ever was. So far from the Darwinian side of the controversy as representing science being closed, it is in reality only opening. An issue, for instance, is looming up between physiological and conventional morality before which all that has gone hitherto will be child's play. Professional ecclesiasticism has learned some discretion, but great masses of the people are steeped in the ecclesiasticism represented by the Christian scientist and Dr. Dowie. In America there are ample materials for a man with the genius for the thing to play the part of a Mahomet in the teeth of both science and traditional ecclesiasticism. It is a trick with the professional ecclesiastic to ascribe movements altogether within the ecclesiastical sphere and giving the historical character of that sphere to a development of scientific ideas, although it is clear that these ideas have not as yet reached the masses. Now, and at no time, is science responsible for ecclesiasticism as it escapes the hand of its professed trainers.

"Criticus" says that the dissociation of medical education from the Universities which I suggest would narrow such education. But my suggestion is that the seven-eighths of us now free from the influence of ecclesiastically-controlled Universities should resist association with such institutions and exactly on the grounds that the association would narrow medical education. Education in such places is, and always has been, the education of prisoners in jails; they have given us centuries of Cathay in the past, and would still, except for outside pressure on them. My

position is that these Universities instead of promoting union and free association among medical men, would sunder them on narrow class, political, and sectarian grounds.

As the social advantages of the Universities do not exist for, and are not desired by, Irish medical men in general, I pass over them; those who have had most experience of them would probably set least value on them.

I set out with the proposition that Irish medical men are apathetic and indifferent to their own interests because utterly powerless as regards their own affairs. Why should they take any interest in Universities over which, as licensing and teaching bodies, they have no control whatever? The only real question that can exist for them now is how they can obtain the control, supposing they venture to think that they ought to have it instead of ecclesiastics and outsiders. There is, I believe, only one way whereby the profession may control licensing power directly, and medical education indirectly. It is, in the first place, by aiming at making the Medical Council the representative body of the profession, and, in the next place, by enlarging its powers when elected by the profession. At present the Council merely inspects examinations; that power should be made real and effective by its appointing examining boards in each of the three kingdoms having the sole right to grant licences. It should further have the duty of licensing schools and hospitals on proof of their possessing adequate provision for medical education. This would leave the schools as teaching bodies as they are, competing to turn out competent men, but not competing in licensing practitioners. The Universities might be left to give M.D. as they do LL.D. and D.C.L. degrees, but the Medical Council would give the right to practice, call to the Bar. The key to this is that the teaching bodies should not license, but be themselves, in respect of their function, subject to test by the licensing body.

What Irish medical men want is an objective, a practical policy which shall unite them. My proposition, I submit, is worth exercising their discursive faculty on. If, however, they can unite on no policy, I would recommend them to adhere to their attitude of silent and dignified reserve and allow their affairs to be regulated as hitherto over their heads. If through fear of their missing the meaning of the term education, they leave their education and its test to ecclesiastics who have no misgivings as to their own view of the term in all its longitude and latitude, they are right to leave the thing to the man who has a mind of his own.

My article in the issue of the 9th was headed, "University Education in Ireland," though I wrote more particularly in relation to medical education. I believe the transfer of the Divinity School from Trinity College to the representative body of the Irish Church to be imminent simply because Irish Churchmen will not, like Irish medical men, allow outsiders to control the education of their profession. It will, however, remain open to the divinity student to take an Arts degree in Trinity College, it is to be hoped, to prevent divinity from narrowing his education. I do not think that medical interests require the separation of the medical school from Trinity College; it is enough to take away from the College its power of licensing clerical, legal, and medical professional men. Law and medicine can, indeed, concede far greater liberty of teaching than divinity, and therefore the law and medical schools might remain in connection with the University. It would, however, simplify the University question to make them altogether independent.

I am, sir, yours truly,

▲ May 19th, 1906.

"YOUR CORRESPONDENT."

DR. DENIS J. COFFEY, Professor of Physiology in the Catholic University School of Medicine has been appointed a member of the Royal Commission to inquire into the affairs of Trinity College, Dublin, and the University of Dublin.

MEDICAL NEWS IN BRIEF.

The Chemical and Physical Society.

A REPRESENTATIVE gathering of members of the Chemical and Physical Society of London paid a visit to the Wellcome Chemical Works and Laboratories at Dartford on the 22nd ult., and were conducted through the various departments. The visitors seemed much interested in the scientific methods and elaborate apparatus employed, and were impressed with the extreme cleanliness everywhere apparent. It was at once recognised that the high standard of accuracy and finish could be maintained only by the exercise of technical skill of a high order, combined with the adoption of methodical systems and perfect organisation. The party then proceeded to the Wellcome Club and Institute, and were shown over the Staff Club House, the Gymnasium, the Library, and the Club House for lady employées, &c. After a walk round the extensive sports fields and other grounds devoted to recreative purposes the visitors were entertained at tea on the lawn.

Birmingham Medical Benevolent Society.

The annual meeting of this Society was held at the Grand Hotel, Birmingham, last week, Dr. A. S. Underhill (retiring president) in the chair. The report of the directors, presented by Mr. W. F. Haslam (hon. secretary), stated that the invested funds now amounted to £15,940, and there was a balance at the bank of £74. Twenty-three annuitants were on the books at the commencement of the year, of whom two died, and one new annuitant was added to the list. The annual value of the grants ranged from £18 to £36, and the sum expended in this way was £704. The Chairman, in moving the adoption of the report, pointed out that there were now 417 benefit members, the same number as at the beginning of the year. Sir James Sawyer, seconding, remarked that in the district covered by the Society, within 50 miles of Birmingham, there were 4,000 medical men, and he thought the number of members might be increased if its beneficent operations were more widely known.

Prizes in the School of Physic, Dublin.

We were able to announce some time ago that the subscribers to the Bennett Fund in Dublin had decided on the form their memorial should take. It is to be a medal presented biennially to the winner of the Surgical Travelling Prize, and a money prize to the second in the examination for the same prize. We understand that Sir John Banks, until a few years ago Regius Professor of Physic, has made an offer to the Board of Trinity College to provide similar awards in connection with the competition for the Medical Travelling Prize. His generous offer has been accepted, the only stipulation made by the Board being that the medal provided by Sir John Banks shall bear his effigy. It will be gratifying to students winning the blue ribbon of the School of Physic in future that they will be furnished with a memento of one or other of two of Trinity's most distinguished sons.

The Middlesex Hospital.

At the annual meeting on Thursday last of Governors of Middlesex Hospital, Prince Francis of Teck in the chair, it was stated that they had received a promise from Mr. H. L. Bischoffsheim to contribute the sum of £5,000 to the hospital to repay advances from the bankers and to meet other immediate expenses. They had also received a donation of £1,050 from Mrs. le F. Greenhill. During the quarter ended March 8th, 1,184 medical, surgical, and obstetrical patients received treatment as in-patients, and 10,853 patients were treated in the out-patients' department. Mr. Andrew Clark, the consulting surgeon, in seconding the adoption of the report, advocated, if possible the extension of the convalescent home, and praised the amount of work which was done in the cancer wards. The secretary announced that the total subscriptions, etc., received

for the quarter amounted to £1,745, an increase of £147 over the corresponding period of last year.

Trinity College, Dublin, Forthcoming Royal Commission.

THE Commission appointed to inquire into Trinity College, Dublin, and the University of Dublin will consist of the following: The Right Honourable Sir Edward Fry, late Lord Justice of Appeal (Chairman); the Right Honourable Christopher Palles, Chief Baron, Ireland; Sir T. Raleigh, K.C.S.I., D.C.L., Fellow of All Souls' College, Oxford; Sir A. W. Rucker, LL.D., F.R.S., Principal of the University of London, late Secretary of the Royal Society; H. Jackson, Esq., D.Litt., Regius Professor of Greek in the University of Cambridge; S. H. Butcher, Esq., D.Litt., late Professor of Greek in the University of Edinburgh; Douglas Hyde, Esq., LL.D., of Trinity College, Dublin; D. J. Coffey, Esq., M.A., Fellow of the Royal University of Ireland, Professor of Physiology in the Catholic University School of Medicine; S. B. Kelleher, Esq., Fellow of Trinity College, Dublin. The terms of reference are as follow:—To inquire into and report upon the present state of Trinity College, Dublin, and of the University of Dublin, including the revenues of the College and of any of its officers and their application, the method of government of the University and of the College, the system of instruction in the College and the teachers by whom it is conducted, the system of University examinations, and the provision made for post graduate study and the encouragement of research; and also to inquire and report upon the place which Trinity College, Dublin, and the University of Dublin now hold as organs of the higher education in Ireland, and the steps proper to be taken to increase their usefulness to the country.

Royal College of Surgeons, Ireland.

THE following candidate having passed the necessary examination, has been admitted a Licentiate in Dental Surgery of the College:—N. Y. Stewart. The following candidates have passed the primary part of the dental examination:—P. M. Black, R. F. Cooper, R. G. Fitchie, H. J. Hedley, S. Miller, T. J. Ollivere, D. M'C. Smith.

OBITUARY.

SIR WILLOUGHBY F. WADE, M.D. DUB.,
F.R.C.P. LOND.

SIR WILLOUGHBY F. WADE, M.D. DUB., F.R.C.P. LOND., who for many years occupied a prominent position in Birmingham, died in Rome last week, where for several years past he had wintered. Deceased took his B.A. Dub. fifty-seven years ago, and was elected to the Fellowship of the London College of Physicians in 1871. He was a Justice of the Peace for Warwickshire, Physician to the Birmingham General Hospital, Senior Physician to the Queen's Hospital, and Professor of the Practice of Physic and Clinical Medicine in Queen's College. A few years since he retired from practice in England and had resided in Florence and in Rome; in both cities he had a considerable following of wealthy patients, by whom he will be missed.

PROFESSOR WILLIAM STIRLING, now Dean of the Medical School of the University of Manchester, is a candidate for the Chair of Physiology in the University of Glasgow, vacant by the resignation of Professor McKendrick.

Mr. H. R. SWANZY, Surgeon to the Royal Victoria Eye and Ear Hospital, Dublin, and Mr. John Lentaigne, Surgeon to the Mater Misericordiae Hospital, have been respectively nominated as President and Vice-president of the Royal College of Surgeons in Ireland for the forthcoming year.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS.

ENGLISH AND FOREIGN.

Specially compiled for THE MEDICAL PRESS AND CIRCULAR,

RECENT GYNÆCOLOGICAL AND OBSTETRICAL LITERATURE.

Ventrofixation Followed by Normal Delivery.—A. Laphorn Smith (*Amer. Journ. of Obstetrics*, May, 1905). After having performed over six hundred operations of various kinds for displacements of the uterus, the writer sees no reason to change an opinion already formed—namely, that when the uterus was normal in size and absolutely free from adhesions, and when there was no indication for opening the abdomen, the Alexander operation for shortening the round ligaments was the ideal one. But when there were adhesions, or when the abdomen had to be opened for some other reason, the operation of ventrofixation gave the greatest satisfaction. About five years ago Smith collected a large number of cases of pregnancy after ventrofixation, nine of which were operated on by himself. He was informed by the doctors who had sent these women that one had a miscarriage at the third month, and that all the others went on to full time and normal delivery, the only symptom referable to their operation being some pain and dragging on the artificial adhesions during the last month. But as far as the labour was concerned, there was absolutely nothing to indicate that ventrofixation had been performed. In conclusion, he states his present attitude as follows:—

1. In all cases in which the retroversion is the only lesion and where certain there are no adhesions he does an Alexander;
2. The only modification made in the technique of the Alexander operation, is to cross one ligament under the skin, tying the two ligaments with a reef knot opposite the right external inguinal ring, which knot is secured from slipping by a few fine catgut stitches.
3. In doing ventrofixation he scarifies a space an inch in diameter on the anterior surface of the fundus, doing same to corresponding abdominal peritoneum and anchors the uterus by two chromicized catgut stitches passed through peritoneum muscles and fascia on both sides, and deep into uterine wall. These stitches must last a month.
4. In both Alexander and ventrofixation operations it is important to amputate the cervix if it is too long—so as to leave the uterus only two and a half inches deep.

Radium Therapy in Pediatrics and Gynecology.—Freeman Abbé (*Amer. Journ. of Obstetrics*, May, 1905). A point which elicits many queries from those who have not done any work with radiotherapy is the method of applying the radium. The salt itself is not consumed in the applications. Only the radiations which are constantly being given off are used. Of these radiations the alpha rays, which are in the greatest quantity, have but slight penetration; the beta rays smaller in quantity, have much greater penetration, while the gamma rays have tremendous penetration, but are very few in number. If the radium be kept in a glass tube, all the gamma, most of the beta, perhaps some of the alpha rays will penetrate the glass and be accessible for use. If kept in an aluminium container all the beta and more alpha rays become available for use. And with a mica disc for a cover a still larger proportion of the alpha rays become available. The writer uses an aluminium container for stricture work, applications to the cervix, &c., and the flat mica covered box for surface work. The glass container is satisfactory even when containing weak radium for analgesic work. Two of the effects of radium, that have not yet been applied therapeutically, may be of interest. It has been shown by experimentation on animals that radium, like the x-ray, produces sterility in both the male and female. In the male the spermatozoa are no longer produced and in the female the Graffian follicles no longer ripen, this sterility has been but temporary lasting a few months; whether longer

exposures would produce a complete and permanent sterility has not yet been demonstrated. To come to the application of radium in pathological conditions. It gives the most satisfactory results in the treatment of birthmarks, lupus, and keloids. It is helpful in late cases of cancer of the uterus to palliate some of the symptoms, and may probably be curative in the very early stages. It is the most desirable treatment of inoperable strictures of the rectum and œsophagus, where it gives more comfort to the patient than colostomy or gastrostomy. F.

Angiomatous Fibroma of the Uterus.—W. Blair Bell and H. H. Clarke (*Journ. of Obstetrics and Gynecology*, May, 1905) report a case operated on for a pedunculated fibroid of the fundus uteri in which they found that the uterus to the right and posteriorly consisted of a large, soft, cystic feeling mass, not unlike an early pregnancy—the surface having the normal smooth uterine appearance. The broad ligaments contained very large tortuous veins. Supra-vaginal hysterectomy was performed, both ovaries and tubes being removed at the same time owing to the doubtful nature of the growth. On cutting into the mass on posterior wall of uterus after removal—a grey-blue semigelatinous mass, in which hard white nodules were interspersed, extruded itself through the incision in the uterine covering which formed the cyst wall, as it were. The cavity of the uterus appeared normal and both ovaries were sclerotic, microscopic. The great bulk of the tumour consists of unstriated muscle fibres. In parts it is very vascular, the vessels having thick walls which have undergone hyaline degeneration. There is also in some places myomatous tissue. It is unusual to see so many vessels in a myoma and the degeneration of the walls is also unusual. Virchow describes a somewhat similar tumour under the name of "complex telangiectatic myoma." It is the writer's opinion, and the opinion of several competent authorities who have seen this specimen, that it is a new growth rather than a degeneration, but so far they have not been able to trace the record of any similar case. The woman was unmarried, 41 years of age, and complained of profuse menstrual periods, considerable pre-menstrual pain, and attacks of severe abdominal pain accompanied by vomiting, in the intermenstrual periods. F.

Amenorrhœa Associated with Serious Eye Symptoms.—J. Gemmill (*Journ. Obstet. and Gyn., Br. Emp.*) cites a case of a girl, æt. 16., whose menstrual periods were normal up to the time she went to a boarding school, when they ceased. In about one month she suddenly became blind in one eye. At the end of three months she was practically blind in both. This blindness was caused by hæmorrhages into the vitreous. Treatment to bring on her periods has brought back the sight of one eye. The prognosis as regards the eye in this condition is not favourable, but if the menstrual period is not re-established it becomes still more grave, as repeated hæmorrhages may cause permanent damage. F.

Spontaneous Inversion of Uterus.—McKay, Wetherby (*Lancet*, April 28th, 1906) reports a case of spontaneous inversion of the uterus. He attended a primipara, the first two stages of whose labour were normal. About fifteen minutes after the birth of the child the patient with a strain expelled the placenta, which was attached to a tumour, which proved to be the fundus of the inverted uterus. Abdominal palpation revealed the absence of the fundus, and instead a hollow. The hæmorrhage was profuse, but after detaching the placenta reduction proved easy. The cavity was

washed with an antiseptic lotion. Beyond feeling faint the patient complained of little, until two hours after the reinversion, when she became very pallid and lost consciousness. Two like attacks followed during the day, but recovery though slow was apyretic and good. H.

Ossification of the Fontanelles and Closure of Sutures at Birth.—A Cause of difficult delivery.—Leahy-Lynch (*Lancet*, May 19th, 1906)—A primipara, æt. 33, completed the first stage of labour normally. The membranes were ruptured artificially, and the head lying in the first position was left to mould. After some time in the second stage, the patient was delivered under an anæsthetic by means of forceps. It was noted that the handles of the forceps were separated when the instrument was locked. Delivery was difficult and took longer than had been anticipated. On examining the child's head—a healthy male child weighing 8½ lbs., and measuring 21 ins.—ossification was found to be complete in the fontanelles and sutures, and such a state was responsible evidently for delay. There was no hydrocephaly. The blades marked the child slightly over the left mastoid region. Various clinical and anatomical authorities are referred to, and a wish expressed to know whether such cases are often met with, and the best means of forming a diagnosis. H.

How Far Shall the Child's Right to Live be Considered During Parturition.—Krönig, Freiburg (*Monatsf. Geb. in Gyn.*, March, 1906) repudiates the old view that the life of the child during parturition is of less importance than that of the mother, and brings forward important statistics in support of his arguments. He advises the immediate delivery of the child in cases of eclampsia by means of the vaginal Cæsarean section. The infantile mortality is thus reduced very considerably. Again, in cases of placenta prævia, the author, with Bumm, prefers the vaginal Cæsarean section to the usually performed version (Braxton Hicks). He also performs this operation in cases of prolapse of the cord, here naturally for the sake of the child alone. With regard to contracted pelvis, he holds that with good technique and proper asepsis, when the woman comes under treatment with an aseptic genital tract, the prognosis, after symphysiotomy and Cæsarean section in relation to the maternal mortality, is not in the least more unfavourable than after craniotomy. Consequently he does not favour the induction of premature labour, owing to the difficulty in rearing the child, and would like it to be completely rejected in cases of contracted pelvis. Since it is practically impossible to know positively when induction of premature labour or prophylactic version are indicated, they are very often performed on patients who, if they had not been interfered with, would have delivered themselves spontaneously. On the other hand, he does not advise symphysiotomy, hebotomie, or Cæsarean section out of relative indications, on women in whom there is any suspicion of septic infection, or who are already infected. In such cases the author would only perform Cæsarean section for primiparae near the menopause, in whom another pregnancy is scarcely to be hoped for, and there is a great desire for a child. Also in patients with inoperable carcinoma uteri, in whom an early death, under any circumstances, is to be expected with certainty. In these cases, however, only the Porro-Cæsarean section with extra-peritoneal treatment of the stump should be considered. G.

The Mortality Connected with Contracted Pelves Formerly and Now.—Baisch, Tübingen (*Monatsf. Geb und Gyn.*, March, 1906) divides the years from 1840 to the present day into three periods, according to the changes which the art of midwifery has undergone in relation to contracted pelves. The first period which is represented by Michaelis, Litzmann, Schwartz, and Spiegelberg may be described as a period of carefully observed expectant midwifery, which, full of trust in Nature, made very little use of high forceps, prophylactic version, and induction of premature labour.

Cæsarean section was reserved for absolute contraction in other cases craniotomy being performed. The next period, with the help of antiseptics, saw the prophylactic operations for the sake of the child systematically performed. The last period dates from the day when Sänger perfected the Cæsarean section and Zweifel the symphysiotomy. These two operations spare us the perforation of the living child and the induction of premature labour with its uncertain results. Statistics regarding the maternal mortality show that the prophylactic operations for the sake of the child without improving its chances, endanger the mother, much more than the expectant treatment with the more frequent performance of Cæsarean section, hebotomie and symphysiotomy. In conclusion, the author points out that owing to the unfavourable prognosis in pelvic compared with vertex presentations, podalic version in transverse presentations should be more frequently replaced by cephalic version. The expectant treatment is in too protracted labour to be shortened by operative measures. The prejudice against the use of forceps in easy cases, where the delay is injuring the child, goes perhaps too far, but in long continued high position of the head both forceps and version are contra-indicated, and hebotomie should be performed to favour the entrance of the head into the pelvis. G.

Lactation and Menstruation.—Heil, Darmstadt (*Monatsf. Geb. u. Gyn.*, March, 1906), comes to the following conclusions as the result of his observations. He agrees with the statements of Mayer, Remfry, and Essen-Möller, that about 50 per cent. of all nursing women menstruate. The onset of menstruation during lactation is not a ground for removal of the child from the breast. On the contrary, menstruating nursing women are not exposed to the danger of uterine atrophy due to lactation. The number of menstruating mothers increases when the suckling is prolonged over the fourth month. This finds a plausible explanation in the theory of Thorn and Fränkel that the uterine atrophy due to the lactation has healed. An explanation regarding the cause of the onset or absence of menstruation during lactation in individual cases cannot be given, for if one were to consider every amenorrhœa as due to lactation atrophy, the cause of the latter is not to be found in some cases. A considerable proportion of nursing women menstruate during one lactation and not during another. It is probable that the menstruating nursing women and not the non-menstruating represent the healthy type. G.

A Case of Severe Uterine Tetany and Spasm of the Internal Os, is recorded by Rühl (*Monatsf. Geb. u. Gyn.*, March, 1906). The patient, æt. 29, a two-para, had a normal labour on first child. On examination forty-eight hours after the onset of pains, the cervix admitted two fingers. The child was lying transversely. Version being impossible owing to uterine tetany, it was decided to wait for full dilatation of the cervix, which, at the end of another three days, had not occurred. As fever arose on the sixth day, decapitation was attempted, but without success. The author was now called in. He found the uterus contracted firmly down on the child, the internal os admitted three fingers, manual dilatation of it was impossible. The spasm of the internal os and the tetany of the uterus did not even disappear under the deepest narcosis. Having failed to decapitate, he eviscerated broke up the body of the child and so extracted it. The placenta was easily expressed immediately after. Puerperium normal. Author advises the *morcellement* of the child rather than Cæsarean section when possible in such cases. G.

NOTICES TO CORRESPONDENTS, &c.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

REPRINTS.—Reprints of articles appearing in this journal can be had at a reduced rate, providing authors give notice to the Publisher or Printer before the type has been distributed. This should be done when returning proofs.

ORIGINAL ARTICLES OR LETTERS intended for publication should be written on one side of the paper only, and must be authenticated with the name and address of the writer, not necessarily for publication but as evidence of identity.

A FORMER VIENNA STUDENT.—We believe the sanitary condition of the city to be as well advanced as any on the Continent; the death-rate, however, is a good deal higher than that of London, chiefly arising from diarrhoeal diseases and infant mortality.

FOURTH YEAR.—The book answering your requirements is the *Manual of Medicine*, by Prof. Monro, of Glasgow, of which a new edition is now before us. It is the one of all others free of "padding," and contains everything you will require at the examinations, expressed in the briefest and most practical manner.

W. F. (Portsmouth).—The most confirmed caviller could hardly find fault with the publication in the local newspaper of the facts connected with a presentation to a medical man of the district, whether in reference to their proposal or realisation.

"A MOVIN' MEDSIN."

A coloured woman threw the odds and ends of medicine left after her husband's death into the fire. The explosion that followed carried the stove through one of the windows. "Mos' pow'ful movin' medsin I eveh saw'd," said she. "No wondah the ole man gone dead.—*American Exchange*.

M. B. (Marlborough Road, W.).—The situation is clearly one of some delicacy. The tale of your patient is probably given in perfect good faith, and the refusal of the wife to see you professionally renders the caution still more necessary. Iritis of specific origin is sometimes treated as an ordinary trititis, without any apparent suspicion as to its real nature. In any case, we imagine, it is your duty to warn the husband as to the nature of his malady.

Meetings of the Societies, Lectures, &c.

WEDNESDAY, JUNE 6th.

OBSTETRICAL SOCIETY OF LONDON (20 Hanover Square, W.).—8 p.m. Specimens will be shown by Mr. H. T. Hicks, Dr. R. H. Bell, and Mr. D. Drew (introduced by Dr. Tate). Short communication:—Dr. W. H. B. Brook: Three Cases of Glycosuria of Pregnancy. Paper:—Dr. G. E. Herman: A Case showing (a) Uterine Contraction without Retraction, (b) Prolonged High Temperature of Nervous Origin.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chenies Street, W.C.).—4 p.m. Mr. P. Paton: Clinique. (Surgical), 5.15 p.m. Lecture:—Dr. B. Abrahams: The Rest Cure.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. F. Taylor: Medicine. 3.15 p.m. Mr. M. Robson: Surgery. 4 p.m. Mr. Cargill: Ophthalmology. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

THURSDAY, JUNE 7th.

NORTH-EAST LONDON CLINICAL SOCIETY (Tottenham Hospital, N.).—4 p.m. Clinical Cases. Dr. T. Hicks, Dr. R. H. Bell, and Mr. D. Drew: (introduced by Dr. Tate). Short communication:—Dr. W. H. B. Brook: Surgical Diseases of Children.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. G. Rankin: Medicine. 3.15 p.m. Sir W. Bennett: Surgery. 4 p.m. Mr. M. Davidson: Radiography. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Ear and Throat.

FRIDAY, JUNE 8th.

WEST LONDON MEDICO-SURGICAL SOCIETY (Kensington Town Hall).—8.30 p.m. Cavendish Lecture:—Sir William MacEwen. Followed by Conversations and Exhibition.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chenies Street, W.C.).—4 p.m. Dr. L. Lack: Clinique. (Throat).

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. R. Bradford: Medicine. 3.15 p.m. Mr. McGavin: Surgery. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Skin.

SATURDAY, JUNE 9th.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

Vacancies.

Littlemore Pauper Lunatic Asylum, near Oxford.—Second Assistant Medical Officer. Salary £120 per annum, with furnished rooms in the Asylum and board. Applications to Thomas M. Davenport, Clerk of the Visiting Committee, County Hall, Oxford.

Hants County Asylum.—Third Assistant Medical Officer. Salary £150 per annum, with furnished apartments, board, washing and attendance. Applications to the Visiting Committee, Hants County Asylum, Fareham.

Sheffield Union Hospital.—Resident Medical Officer. Salary £100 per annum, with apartments and rations. Applications to Albert

Edwd. Brooker, Clerk to the Guardians, Union Offices, Westbar Sheffield.

North-Eastern Hospital for Children, Hackney Road, Bethnal Green, E.—Resident Medical Officer. Salary £100 per annum, with board, residence, and washing. Applications to T. Glenton-Kerr, Secretary.

Barnsley Hall Asylum, Bromsgrove, Worcestershire.—Medical Superintendent. Salary £800 per annum, with an unfurnished house, with fuel, electric light, washing, and garden produce. Applications to Robert J. Oliver, Clerk of the Visiting Committee, Shirehall, Worcester.

Perth District Asylum, Murthly.—Assistant Physician. Salary £120 per annum, with board and residence. Applications to Dr. Bruce, Phys.-Supt., Murthly, Perthshire.

Princes Christian Hospital, Sierra Leone, West Africa.—Salary £250 and rooms. Applications to Rev. Arthur Sinker, St. Anne's Vicarage, Hermondsey, S.E.

Saint Andrew's Hospital for Mental Diseases, Northampton.—Junior Assistant Medical Officer. Salary £200 per annum, with board, lodging, and washing. Applications to the Medical Superintendent.

Brecknock County and Borough Infirmary.—Resident House Surgeon. Salary £100 per annum, with furnished apartments, board, and attendance, fire, and gas. Applications to W. Powell Price, Secretary, 6, The Bulwark, Breton, South Wales.

Bristol Royal Hospital for Sick Children and Women.—House Surgeon. Salary £80 per annum, with board, rooms, and attendance. Applications to H. Lawford Jones, F.C.L.S., Secretary.

Salford Royal Hospital.—Junior House Surgeon. Salary £90 per annum, with board and residence. Applications to George Ruddle, Secretary and Superintendent.

Appointments.

ATKINSON-FAIRBANK, J. G., M.B., L.R.C.P., M.R.C.S., L.D.S. Eng.—Demonstrator to the Royal Dental Hospital of London.

BALL, L. C., L.D.S., Eng.—Demonstrator to the Royal Dental Hospital of London.

CAMERON, ISABELLA D., M.B., B.S. Edin., appointed by the Carnegie Dunfermline Trustees as Assistant to Dr. R. V. C. Ash in connection with the medical inspection of school children in Dunfermline and also as Lecturer in the College of Hygiene and Physical Training.

GILLES, ARTHUR, M.D., M.R.C.P. and R.C.S., Surgeon to In-patients at the Chelsea Hospital for Women.

HAYES, T. CRAWFORD, M.D. Dub., F.R.C.P. Lond., Professor Emeritus of King's College and Consulting Physician to King's College Hospital.

MCDOWALL, COLIN F. F., M.B., B.S. Durh., Second Assistant Medical Officer to the Newcastle-upon-Tyne City Asylum.

MCKAY, ROBERT, I.R.C.P. Lond., M.R.C.S., L.D.S. Eng., Assistant Dental Surgeon to the Royal Dental Hospital of London.

PATON, E. PERCY, M.D. Lond., F.R.C.S. Eng., Examiner in Surgery to the Society of Apothecaries.

RICHARDS, OWEN, M.D. Oxon., F.R.C.S. Eng., Surgeon to Kasr-el-Ainy Hospital and Professor of Clinical Surgery in the Egyptian Government School of Medicine.

RITCHIE, A. L., M.B., B.S. Aberd., Certifying Surgeon under the Factory and Workshop Act for the Cavendish District of the county of Suffolk.

SARGENT, PERCY W. G., M.B., B.C. Cantab., F.R.C.S. Eng., Assistant Surgeon to the National Hospital for the Paralysed and Epileptic, Queen Square.

Births.

BATEMAN.—On June 1st, at Heath End, Blackheath, the wife of F. J. Harvey Bateman, M.A., M.D., of a son.

DOWNES.—On June 2nd, at 106 Elm Park Gardens, London, the wife of Arthur Downes, M.D., of a daughter.

LAMPLOUGH.—On May 31st, at Kirkstall, Alverstoke, Hants, the wife of Charles Lamplough, M.D., of a son.

Marriages.

CHAMBERS—BELL-NEALE.—On June 2nd, at St. Dominic's Priory Haverstock Hill, London, Major Alexander Jasper Chambers, Royal Army Medical Corps, Netley, elder son of Charles Chambers, 35 Manor Road, Folkestone, to Helen Louise, second daughter of the late John Bell, of Southsea.

METCALFE—TURNBY.—On June 2nd, at All Saints', Mettingham, Kenneth Metcalfe, of Blantyre, British Central Africa, youngest son of Robert Ives, Metcalfe, Esq., M.D., of Beccles, to Winifred Lake, second daughter of the late Henry Turney, Esq., of Stourbridge, and of Mrs. Turney, of Mettingham House, near Bungay, Suffolk.

PAGE—SYMES-THOMPSON.—On May 29th, at St. George's, Hanover Square, Arthur Page, of New Court, Temple, son of N. Page, Esq., J.P., of Woodlands, Croydon, to Margaret Watkins, younger daughter of E. Symes-Thompson, M.D., F.R.C.P., of 33 Cavendish Square, and Finmere House, near Buckingham.

ROTHERHAM—BOILEAU.—On June 1st, at St. Michael and All Angels', Monkton Combe, Bath, Frank Herbert Rotherham, M.B. Lond., second son of the late Geo. S. Rotherham, of Corentry, to Hazel Durie, second daughter of Major L. M. Boileau, I.S.C., retd., of Combe Down, Bath.

Deaths.

HICKS.—On May 28th, in London, George Augustus Hicks, M.R.C.S., L.R.C.P., of Bournemouth East, son of the late Thomas Hicks, Esq., of Torquay, in his 70th year.

WADE.—On May 28th, at Rome, Sir Willoughby Wade, M.D., late of Birmingham.

No. 24

NOTES AND COMMENTS.

The London Hospital as Popular Educator. THE management of the London Hospital certainly understand the art of keeping before the public. The light cure for lupus has been constantly paraded by them in the lay press, often in connection with names of the medical staff. Needless to say, the merits of that particular method are by no means scientifically established. The process is tedious, uncertain, costly, and the malady is apt to recur. In a word, it compares unfavourably with other surgical and medical measures practised for the relief and cure of lupus. That view, however, is not accepted by the lay board of the London Hospital, who advocate the light treatment with whole-hearted enthusiasm in season and out of season. Whatever doubts may pervade the professorial mind, none find even a momentary existence in the brain of the lay members of the London Hospital Committee. They advocate Finsen light treatment as the best possible method of treatment in lupus, and that is enough. Some of them go so far as to denounce "scraping," and other barbarous surgical measures. Well may the medical profession ask What is the basis of this new pseudo-scientific authority that has sprung up in our midst!

Where are our Medical Men? WHY should not a highly technical matter of medical research be announced to the world through the usual channels? What is there peculiar to the committee of the London Hospital that it should take upon itself to inform our countrymen upon the value of the light treatment in lupus? Not only that, but this enterprising committee of laymen have added to that essay a manifesto upon the opsonic index. If the Finsen treatment be from a scientific point of view in the clouds, the opsonic index is a hundred times more so—inasmuch as in its present form it is practically out of reach of ninety-nine hundredths of all medical practice, and, at the best, its precise and overwhelming value has not been demonstrated. These facts, however, do not hinder these enterprising laymen from advertising their faith, and, incidentally, the claims of their hospital upon the public purse, in the two ultra-scientific methods in question. That abstruse and tentative medical science should filter to the world through the medium of a lay hospital committee is farcical,

impertinent and altogether derogatory to the dignity that should govern and control the policy of a great and noble charity.

General Medical Council - Arrogance. THE contemptuous refusal of the General Medical Council to increase the number of direct representatives to the maximum permitted by the Medical Act of 1886 will not readily be forgotten. By fifteen votes to six the proposal was rejected. Eight members did not vote, though why a man should efface his representative position in so vital a matter is somewhat of a mystery. As a specimen of class arrogance the attitude of the Council with regard to the medical profession is unique in its intolerance. The only thing at all resembling its jealous protection of privilege is to be found in the House of Lords. However, the day is gone by for such an anomaly as that of a great profession like that of medicine being misrepresented and misgoverned by a handful of representatives, more or less fossilised corporations without a grain of sympathy for the outside medical practitioners. We trust our direct representatives will continue their efforts year after year to remove an abuse worthier of repressed Russia than of a free and enlightened United Kingdom.

Mr. Chiozza Money on Big Fees. WE recently commented on an extraordinary reference by Mr. Chiozza Money in the *Daily News* to the "fashionable surgeon, who wastes his time dancing attendance upon well-to-do vermiform appendices." Mr. Money, as an owner of that fateful anatomical survival, may one day welcome the attendance of a skilful surgeon at any price. Surely it cannot have escaped the notice of so eminent an economic authority that the services of the highly-qualified surgeon may be had free, gratis and for nothing in hospital if the sufferer cannot afford high fees. The *Daily News*, however, has treated our remonstrances with lofty contempt. The same journal, moreover, has mutilated the critical letter of a correspondent, whose original communication—departing from our usual custom—we reproduce in full in another part of the present issue. This course we consider justifiable in view of the slanderous nature of Mr. Money's allusion to the work of the surgeon.

LEADING ARTICLES.

INFANTILE MORTALITY AND THE | POPULATION QUESTION.

THE question of the excessive infantile mortality is one with which the medical profession is in every respect tolerably familiar; they need little, if any, enlightenment as to its causation or prevention. The question, however, calls for recognition by the mass of the people, who are to a vast extent entirely ignorant upon it; and its importance needs proper appreciation by statesmen, legislators, philanthropists, and publicists, upon whom the promotion of improvement so largely depends. It is satisfactory to learn that a conference on the subject, called together by the President of the Local Government Board, is to be held in London on June 13th and 14th. Besides representatives of public health authorities and medical associations, delegates from parish councils and school-boards are to be invited. The programme is a wide one; and the conference cannot fail to help in diffusion of knowledge in those directions where it is most urgently required. A great part of the present infantile mortality is preventable. The causation is complex, but the main factors are improper food and feeding, bad housing, foul air, filth, and overcrowding, together with neglect and ill-usage due to dense ignorance or wilful cruelty on the part of parents. The waste of life would be less deplorable if it did not form a measure of injury to the national physique by which it is accompanied. For every infant dead a number survive with damaged constitutions owing to the ordeal of mal-nutrition and acute disease through which they have struggled. The birth-rate at the same time is rapidly falling—the last returns are the lowest on record—and it is more than ever important for the national welfare that our increase, if small in quantity, should be of the best in quality. We wonder how many of our leading statesmen are giving attention to the population question in its widest aspect. How many of them have pondered the significance of the figures in the lately published census of the Empire. The census shows that in these islands, our colonies, and India, the white population altogether numbers only 55,000,000, whilst the coloured races form a total of some 400,000,000. None of our colonies suitable for a population of European blood contain more than an insignificant fraction of the millions they are capable of being made gradually fit to sustain. In some of them the birth-rate is falling at a pace which, as at home, will before many years, if continued, result in a stagnation of population as complete as that which has been brought about and maintained for thirty-five years among our neighbours the French. In the meantime, the population of the German Empire at home, increasing at the rate of 1,000,000 a year, now stands at 61,000,000, a significant fact for statesmen to reflect upon. Whatever role the mighty Teutonic people is destined to take in the evolution of the races, there

can be no doubt that nations in decay are at this present epoch as surely doomed to be gradually conquered or supplanted by more virile stocks as they were in the old days when the barbarian came down upon Rome. If we do not become prepared to colonise our magnificent over-sea possessions, where there is room for our natural increase for the next five hundred or perhaps thousand years, these eligible lands will in due course be over-run by races white or yellow who have not been affected by the vices of civilisation which already threaten to destroy some of the nations of Western Europe. The dream of a mighty British Empire, invulnerable by reason of the vast number of its properly organised populace—an Empire where peace, law, and liberty, the progress of humanity, shall be assured—the realisation of this dream depends upon the proper solution of the population question. This problem cannot be solved without sacrifice. A people whose motto is, "Let us eat, drink, and be merry, for to-morrow we die," who ask with the French cynic, "What has posterity done for us that we should sacrifice for posterity?"—a people pervaded by the spirit of anti-social egoism which subordinates every consideration to the desire for a life of ease and luxury, is surely doomed to destruction. Science is able to demonstrate with sufficient clearness that the pursuit of such an ideal can never lead to true happiness; and as the representative of science, the medical man may here co-operate with the religious teacher in the attempt to save modern society from the perils by which it is evidently becoming more and more encompassed. Viewed in these lights the question of infantile mortality is seen in its true size and shape—a much bigger thing than can ever be suspected, revealed, or explained by any merely superficial examination.

THE TIMES AS CENSOR MORUM.

A CORRESPONDENT, whose letter will be found in another column, has drawn our attention to a leading article in *The Times*, Friday, June 1st, on the meat scandal in Chicago. The article thus referred to is in every way a first-rate specimen of editorial writing, whether as regards its literary quality, its argument, or the lesson it inculcates. It ends with a severe indictment of democratic institutions and of the society which tolerates the abuses possible beneath them. It is at bottom all due to "a brutal system carried out by brutal agents, a system by which, in a land supposed to be free and democratic, the plutocrat grinds the souls of men and women as ruthlessly as his machines disintegrate his tuberculous cattle, his cholera-smitten hogs, and his putrid hams. Universal suffrage, universal education, omnipresent free libraries, all the panoply of modern panaceas for the abuses supposed to be inseparable from older regimes, result in a tyranny more body and soul destroying than any exercised by autocrats or feudal oppressors." These revelations have brought forward an "appeal for Socialism to redress the evils of individualism run mad. But who shall guarantee that men such as have captured the industrial machine will not also capture the State machine of the Socialist Utopia? Had we not better—and in this country, perhaps, as

well as in the United States—hark back a little to the ideas of an older morality, and try to restore in the community something of the notions of duty, and of simple living which are now unhappily much out of fashion?" Readers of THE MEDICAL PRESS and all those acquainted with the present day business methods of *The Times* will be disposed to ask why the Editor of the leading journal does not look at home, why does he not appeal to his employers, the proprietors of the paper, to set an example in the practice of the morality the ideas of which we are losing? Why do not the proprietors of *The Times* begin by refusing to augment their income by abetting a traffic denounced frequently in their own columns. Why does *The Times* now freely admit the advertisements of quacks and quack medicine vendors described not so long ago in their editorial pages as "some of the most complete and finished of the many impostors who are parasitic upon modern civilisation"? Why does not *The Times* endeavour to put a stop to a system which it described as "undermining the health of so many victims"? If the proprietors are not aware of the character of the trade which their editors a few years ago frequently exposed, why do not they make inquiry, and in the meantime if their income should be diminished they might set an example in "duty and simple living which are now, unhappily, so much out of fashion."

NOTES ON CURRENT TOPICS.

The Council Election at the Royal College of Surgeons, England.

THE annual election of members of the Council of the Royal College of Surgeons, England, takes place on July 5th, at which three vacancies will be competed for, under the rule of compulsory retirement. The retiring councillors are Mr. John Langton, Mr. Richardson Cross, and Mr. Henry Morris. Mr. Langton will not seek re-election, while Mr. Morris and Mr. Cross have decided again to seek the suffrages of the Fellows. In addition to these two candidates, we hear that Mr. George Arthur Wright, B.A., M.B.Oxon., F.R.C.S., Professor of Surgery at the Victoria University, and Surgeon to the Royal Infirmary, Manchester, will come forward, as well as Mr. Charters Symonds, F.R.C.S., Surgeon to Guy's Hospital. Thus far, then, there are two metropolitan surgeons, and two provincial surgeons who will compete for the three vacancies. The re-election, we may anticipate, of Mr. Henry Morris is a foregone conclusion, owing, apart from his high surgical position, to the claims which he has upon the Fellows for the valuable work which he has done for the College during his past term of office. On the other hand, the fact that two provincial surgeons should have decided to go to the poll introduces a difficulty, since it is doubtful whether the provincial Fellows will be prepared to run both candidates. Possibly, therefore, the Fellows in the provinces will cast their votes for one or other of their representatives and not for two,

and distribute their support in other directions. It would be entirely unprecedented were two provincial Fellows to be successful at the poll at one election. Under the circumstances, then, it will be of interest to see how the votes will be cast in this regard. Meanwhile, no doubt college politics being dead so far as the Fellows are concerned, vigorous canvassing will take place among the personal friends of the candidates to ensure the success of their respective nominees. Just as we go to press we learn of another candidate, namely, Mr. Bruce Clarke, surgeon to and lecturer on surgery at St. Bartholomew's Hospital. Mr. Clarke is also a member of the Court of Examiners, and it will be remembered that last year he magnanimously withdrew his candidature in favour of his senior colleague, Mr. Harrison Cripps, who was successful. Mr. Bruce Clarke, who is possessed of sound business qualities, would in many ways be a useful and excellent addition to the Council of the College under its present antiquated constitution.

The "Medical Register."

UNDER existing circumstances one of the most valuable functions of the General Medical Council is the correct keeping of the *Medical Register*. Needless to say, the work involved in their duty is arduous and exacting, and to be carried out successfully demands the co-operation of members of the medical profession. In view of the approaching elections of Direct Representatives, it is specially desirable that all practitioners should assure themselves that their correct addresses are inserted; otherwise they will not only be disfranchised, as the Council will be debarred from sending voting-papers, but they will also incur the risk of having their names erased from the *Register*. In the present year the usual circulars of inquiry have not been issued, inasmuch as the mere sending out of voting-papers will in itself furnish a means of correction. It is a self-evident duty, indeed, for medical men to verify the correctness or otherwise of their reference in the *Register*. We may perhaps venture to urge upon every practitioner in the United Kingdom that he should this year take that obvious precaution before leaving for his summer or autumn holiday. Specific questions will always find a ready answer from Mr. James E. Allen, the courteous Registrar of the General Medical Council, Oxford Street, London.

The Sight-Testing Bill.

WE are glad to see that the General Medical Council has expressed strong views with regard to the Bill promoted by the British Optical Association in regard to sight-testing opticians. The occasion is one of unusual interest, since it is, we believe, the first time that the Government has invited the General Medical Council to express an opinion on a Bill before Parliament which is thought to affect the medical profession. In return, the Council has declared "that it would be dangerous in the public interest to confer the privileges and powers contemplated therein (*i.e.*,

in the Bill) on persons other than those duly qualified in medicine and surgery." Obvious as this is to all instructed persons, the Council is well advised in supporting its opinion by a memorandum detailing the grounds on which it is based, as otherwise its opposition would doubtless be regarded by some as sprung from mere jealousy. It can never be too strongly impressed on the public that our opposition to quack practice is based not on our own interests, but on the safety of the public. It is to be hoped that the Government may be moved by the advice they have received to stop the Bill from further progress. It is to be hoped, too, that the precedent established in this case may be followed, and that the General Medical Council may take its proper place as the adviser of the Government on all matters affecting the profession.

The Army Medical Service.

WE are glad to note that Mr. Brodrick, by his letter to *The Times* last week, has directed public attention to the present position of the Army Medical Service. The medical papers have never ceased to urge that for the safety of the Army it is necessary that the Director-General should have immediate access to the Secretary of State, and should be present at the meetings of the Army Council. As Mr. Brodrick points out, "a large proportion of the questions which come before the Army Council necessarily involve medical opinion." We may add that in future this proportion is likely to grow larger. It seems almost impossible to impress on the older combatant officers that only the smallest part of an Army surgeon's duty is to treat wounds. Under present conditions his principal occupation both in peace and war is the treatment of disease, but this is not as it should be. The most important duty of an Army Medical Service—and we hope that this will soon be universally recognised—should be to prevent disease. That other nations have not been slow to profit by our own disastrous failures in this respect is shown by the extremely low rate of disease in both the Japanese and Russian armies in the late war. The present position of the Director-General as a subordinate to the Adjutant-General, through whom alone he is in communication with the Secretary of State and the Army Council, is not such as to give his views the prominence they deserve in the discussion of matters affecting the health of the Army.

An American in Harley Street.

THE stress of sheer quack competition falls with disastrous effect upon the legitimate medical practitioners of the United Kingdom. It will indeed be an evil day when that injury is supplemented by the invasion of legally-qualified men from other countries who conduct their practice on the lines adopted by pushful tradesmen. Recently "an American gentleman," Mr. Le Grand N. Denslow, of Harley Street and Dorset Square, London, has been run to earth by the Medical

Defence Union. Some time since advertisements appeared in the daily newspapers from a person who stated he had been cured of locomotor ataxy, and offering to inform sufferers where they could get similar relief. Upon application, the address of Denslow was obtained by a clerk, who persuaded the great specialist to accept for a friend a fee of one hundred guineas, fifty pounds to be paid at once, and the balance by agreement. The prosecution charged Denslow for falsely pretending to be, and using the titles of, a doctor and a physician, thereby implying that he was registered under the Medical Acts of 1858 and 1886. The fine imposed for this impudent defiance of British law and professional tradition was £30, with £10 10s. costs, a mere flea-bite compared with the fees that appear to have been extorted from patients. However, it is to be hoped that the exposure will cause others holding foreign qualifications to hesitate before invading the United Kingdom. The result of the prosecution places another feather in the cap of the Medical Defence Union.

Premature Burial.

THE Society for the Prevention of Premature Burial rests upon a somewhat shaky foundation. It assumes that unfortunate human beings are systematically buried alive, and seeks to prove that position by cases in which persons have not been buried alive and of alleged live burials that will not stand the test of critical examination. The only serious scientific investigation of the matter hitherto written was that contained in a small volume published some years ago by Messrs. Bailliere and Cox, under the title, "Premature Burial: Fact or Fiction?" One of the axioms of the author is that it would be impossible for the signs of life to elude careful and competent medical examination. At the same time, he insists that no single undoubted case of live burial has been conclusively proved in the whole of the vast literature of the subject. The term "conclusive" he defines as proved by evidence that would satisfy a court of law. In other words, the position of those who form a society to meet a danger that has not been shown to exist is ludicrous. Yet so absurd and unscientific a proceeding is supported by several medical men, whose presence in that galley can be accounted for only by the fact that medicine has not yet attained the position of an exact science, and that medical men are perforce largely empirical in their intellectual methods.

Direct Representatives on the General Medical Council.

AT the recent session of the General Medical Council the question of the increase of the direct representation of the profession on the Council was discussed on the motion moved by Mr. George Brown suggesting that request should be made to the Privy Council to raise the number of direct representatives to the maximum allowed by the Medical Act of 1886. Now, though the Council is

beginning to awake to a sense of its duties, it is doing so by slow and uneasy stages, and one cannot therefore be surprised at the views expressed by the representatives of the interested corporations which hold so unfair a proportion of the seats. Dr. Little went so far as to say that the great duty of the Council was to enable the public to distinguish between qualified and unqualified practitioners, and that it was only a secondary part of its functions to look after the interests and honour of the profession. It is precisely on account of such views being held that the present constitution of the Council calls for radical change if any real advance is to be made in the status and well-being of the profession. It is as absurd as it is unjust that the government of the profession should be in the hands of the nominees of the Universities and Medical Colleges, whose first object is to promote the continuance and extension of their own privileges, and the fact that the motion was lost by a two to one majority shows that the profession must not cease to make its voice heard if it is to obtain justice in this matter. It is a pity that the question should be complicated by the intention of the British Medical Association to run its own candidates for the seats of the direct representatives, as this action has been raised as an excuse for objecting to an increase. Not much is likely to be gained by making the direct representatives the nominees of the Association, responsible to carry out its policy and no other.

Diocesan Congress and Faith-Healing.

THE London Diocesan Congress in the course of its annual May meeting discussed *inter alia* the subject of faith-healing. They hold that Christian Science, improperly so-called, has obtained among church people has caused some heart burning among ecclesiastics, and of late they have been giving some attention to the matter. The crude absurdities of "Eddyism" do not commend themselves to modern Churchmen in responsible positions, but the power of faith in healing is a weapon which they think has been neglected. Archdeacon Sinclair, who opened the discussion spoke strongly against certain of the doctrines of Christian Science as purveyed by Mrs. Eddy, showing that they were absolutely at variance with Church teaching and common-sense, but although he advocated a larger use of prayer and faith in the promotion of the cure of the sick he laid great stress on the fact that such means should be supplementary to the employment of medical and surgical aid. Lord Halifax as an advanced Ritualist, was in favour of reviving the practice of anointing the sick and it is interesting to learn from the Bishop of London that his colleagues in lawn are already giving the question their earnest consideration. It is a curious commentary on the difference existing between the ecclesiastical and the scientific habit of mind that the Bishop considered the propriety of the laying on of hands and of anointing the sick was a matter for historical research to determine

rather than one whose utility should be demonstrated by experiment before adoption. But it certainly is something gained that the Church as a whole has remained unimpregnated by the silly chatter of hysterical American women.

PERSONAL.

H.M. KING EDWARD, accompanied by the QUEEN, will to-day (Wednesday) formally open the Midhurst Sanatorium for Consumption at 4.30 p.m.

SIR CHARLES TUPPER, the veteran Canadian pioneer and statesman, now in this country, is nearing his eighty-fifth birthday, and sixty-three years ago took his degree of M.D. at Edinburgh.

DR. E. A. G. DOYLE, Resident Surgeon of the Colonial Hospital, Port-of-Spain, Trinidad, has been made District Medical Officer of South Naparima, and is succeeded at the Colonial Hospital by Dr. E. N. Darwent, of the San Fernando Hospital.

It is announced that Sir Frederick Treves will deliver a lay sermon on Hospital Sunday, June 17th, at 11 a.m. in Union Chapel, Islington.

MR. F. H. MORISON, M.D., has been appointed to the Commission of the Peace for the borough of West Hartlepool.

DR. ROBERT KOCH has resigned his position on the presidential board of the Berlin Medical Society, on the ground of his engagements in Africa, in connection with the investigation of sleeping-sickness. Professor Koch expects to be absent two years.

THE Fellows of the Royal College of Surgeons of England will, on Thursday, July 5th, proceed to the election of three members of Council, those who retire by rotation being Mr. John Langton, Mr. Henry Morris, and Mr. F. Richardson Cross. Mr. Langton was first elected in 1890, and has served for two terms of eight years. Mr. Henry Morris was first appointed in 1893. Mr. John Tweedy's term of office would also have come to an end, but having been re-elected president last July, he remains a member of the Council.

DR. A. DOUGLAS HEATH, M.D., M.R.C.P., M.P.C.S., has been appointed dermatologist for the new department of skin diseases of the Birmingham General Hospital. In the same Institution, Dr. A. Stanley Barnes, M.D., B.Sc., M.R.C.P., M.R.C.S., M.B., Ch.B., has been appointed assistant physician in place of Dr. G. H. Perry, resigned.

DR. W. M. HAMILTON, at one time Mayor of Eccles, was last week invested by the Earl of Lathom as Provincial Grand Registrar of West Lancashire to the great satisfaction of a large number of the Brethren in the Borough of Eccles.

MR. M'ARDLE, F.R.C.S.I., Surgeon to St. Vincent's Hospital, has been elected President of the Irish Medical Association for the ensuing year. Professor Byers had been elected President of the Belfast Branch of the Association.

MR. J. NIELD COOK has had an extension of eighteen months in the tenure of his office of Medical Officer of Health for Calcutta.

DR. ALEXANDER PEDDIE, the oldest medical practitioner in Scotland, has completed his ninety-sixth year. Some years ago he gave an interesting Harveian Lecture, which dealt largely with the life of Dr. Brown, the author of "Rab and His Friends."

A CLINICAL LECTURE ON INFLAMMATION OF THE CONJUNCTIVA,

Delivered at the Glasgow Ophthalmic Institution.

By A. MAITLAND RAMSAY, M.D.,

Professor of Ophthalmology at St. Mungo's College; and Lecturer on Eye Diseases at Queen Margaret College, University of Glasgow.

INFLAMMATION of the conjunctiva is so common that you will, at the dispensary, in a very short time, see a considerable number of cases; nor will you be long in private practice till you are called upon to treat a patient suffering from conjunctivitis. That this should be so is clearly due to the exposed position of the eyes on the face. The inflammatory changes which occur will be best understood if I first say a few words regarding the normal anatomy of the parts concerned.

The conjunctiva is a mucous membrane which lines the inner surface of the eyelids and is reflected to cover the whole of the anterior surface of the eyeball. When, therefore, the lids are closed the membrane forms a sac with a slit in the anterior wall corresponding to the palpebral fissure. Up to a certain stage of fetal life, indeed, the sac is complete, for the eyelids are firmly united till the growth of the eyelashes brings about separation along the anterior portion of the union, and thereafter degeneration of the epithelial cells leads to separation of the posterior and central portions. Some animals—cats and dogs, for example—are even born with the lids sealed, and this state of matters persists for several days after birth.

For convenience of description, the membrane may be divided into three portions—that lining the lids (*conjunctiva palpebrarum*); that covering the globe (*conjunctiva bulbi*); and the fold of transition (*conjunctiva fornicis*). The palpebral portion is firmly united to the tarsus, over which it is so tensely stretched that it is impossible to dissect it from the underlying structures in order to obtain flaps for the repair of a breach of surface. In this it presents a marked contrast to the bulbar portion, which is loose and freely movable as far as the limbus. From that point, however, where it becomes the epithelial layer of the cornea, it is firmly bound down. At the retrotarsal fold the membrane is loose, and is arranged in a series of ridges which stretch readily so as to accommodate the conjunctiva to the movements of the eyeball. In the whole of the conjunctival epithelium, but especially in that covering the globe and in the retrotarsal fold, there are normally present goblet cells which, owing to their contents consisting largely of mucin, have been called "unicellular mucous glands." According to Greef this latter name indicates their true function, which is to moisten and protect the conjunctiva and cornea; so that even extirpation of the lachrymal gland is innocuous; while, on the other hand, xerosis of the conjunctiva, involving their destruction, leads to desiccation in spite of a copious flow of tears. On no other part of the human skin, as has been pointed out by Harman, does this primitive glandular secretion of mucin persist, and its purpose here is evidently to provide the eyeball with a smooth frictionless surface to facilitate ease of movement.

When the conjunctiva is healthy, it is perfectly transparent, for the blood vessels and lymphatics with which it is abundantly supplied are so minute that, with one or two exceptions, they are invisible and in no way modify the whiteness of the underlying sclerotic. In general venous congestion, however, there is usually injection of the larger conjunctival vessels, and the appearance of the membrane is often characteristic of peculiar constitutional states.

Notwithstanding that the conjunctiva is the most accessible of all the mucous membranes, its pathology is far from being thoroughly understood. It has been studied too much from the standpoint of the specialist, and too little from that of the general pathologist,

which is the proper point of view. If it is to be properly understood it must be regarded as a mucous membrane, similar to, and governed by, the same physiological and pathological laws which control every other mucous membrane in the body. Its diseases must, therefore, be studied in their whole pathology, and looked at in this way it is capable of affording a large amount of information of great value both in diagnosis and in treatment. Abnormal paleness for example is always associated with anæmia, and a peculiar yellowness is one of the earliest as well as one of the most constant signs of jaundice.

Whenever any irritant—physical, chemical, or microbic—gains entrance to the conjunctival sac, the mucous membrane becomes at once congested, and in proportion to the amount of the hyperæmia the white of the eye is concealed by an intricate meshwork of injected blood-vessels. The resulting redness is one of the earliest as well as one of the most characteristic signs of conjunctival inflammation. Every eye that is red is not, however, to be regarded as suffering from conjunctivitis, and careful examination will readily distinguish injection of the superficial or conjunctival vessels from hyperæmia of those that are more deeply placed. In the former condition, which denotes inflammation of the conjunctiva, the tint is brick-red, most intense in the region of the retrotarsal fold; the congested vessels are comparatively large and tortuous, and are arranged in the form of a network freely movable with the ocular conjunctiva; pressure will momentarily drive the blood away and expose the sclerotic; there will be lachrymation and intolerance of light; and the pain is similar to that experienced when a foreign body is lodged between the lids and the ball.

Hyperæmia of the deep-seated vessels denotes implication of the cornea or iris, and then the colour is rose-pink and the congested portion forms a zone round the cornea; the distended vessels are minute and hair-like and lie in the episcleral tissue under cover of the conjunctiva; pressure does not materially diminish the amount of vascularity; the pupil does not react promptly to the stimulus of light; and the pain complained of has a characteristic throb, is markedly nocturnal, and is usually circumorbital. Should the injection be localised, the fascicle of blood-vessels running towards the cornea invariably terminates in a phlycten or an ulcer; and should the vessels, more especially the veins, be large and varicose there is probably deep-seated mischief in the choroid, and the more livid the congestion the more serious the inflammation. Where, as is very often the case, superficial injection and deep injection co-exist, it is, as a rule, easy to determine by careful inspection which of the two predominates.

Not only is inflammation of the conjunctiva very common, as has been already said, but it shows itself in many forms; and according to Harman it occurs most frequently in the early years of life, in the female sex, in the months of April, May, and June, and among the poor, the dirty, and the overcrowded. That there should be many varieties is just what we would expect when we consider how the epithelium lining the different portions of the conjunctiva varies. Over the lids it is cylindrical with the characteristics of a mucous membrane, while over the globe it is of a stratified pavement form allied in structure to the skin. Clinically this is important because in all inflammations primarily affecting the palpebral conjunctiva hyperæmia with secretion is the most important objective

sign; while those of the bulbar conjunctiva are distinguished by the occurrence of phlyctens or papules similar to those found in cutaneous eruptions. Immediately beneath the epithelium is a very thin layer of adenoid tissue which in the retrotarsal folds forms small clumps—a peculiar arrangement that explains the occurrence of the lymphatic follicles forming the principal clinical feature of inflammations originating in this region.

The discharge which occurs in all cases where the palpebral conjunctiva is primarily affected is highly infective, and is virulent in direct proportion to its profuseness and yellowness. It varies in its nature, but each variety reproduces its like by direct contagion, a result probably always due to the presence of some particular micro-organism; and while it is not at present possible to classify all forms of conjunctivitis on this basis alone, yet certain specific organisms have been found to be invariably associated with certain inflammations.

In the healthy conjunctival sac all the ordinary bacteria have been found present, but only a few of them have been proved to be pathogenic. That their presence is not more harmful is probably due in part to the bactericidal action of the tears which, when normal (that is, slightly alkaline in reaction), seem capable of neutralising the virulence of many micro-organisms. When, however, the reaction of the tears is acid, the conjunctiva is much more readily attacked by microbes. Micro-organisms have the power of producing certain poisonous substances, infinitesimal quantities of which can cause inflammation and disease in general; and it is these toxins, and not the bacteria themselves, that penetrate deeply into the tissues of the body. As the specific action must therefore be looked on as chemical, a suitable medium is essential for the development of the microbe and the full exercise of its pathogenic powers; and so the condition of the conjunctiva at the time of infection is, to a great extent, the dominant factor in determining which micro-organism shall become the agent of mischief.

While histological peculiarities of structure, therefore, undoubtedly modify the results of infection, it is also clearly demonstrated by clinical observation that diathesis plays a most important part not only in influencing the course of the inflammation, but also in determining the particular form it may assume. For example, conjunctivitis occurring in a strumous patient is usually characterised by the presence of pustules or phlyctens on the bulbar conjunctiva, whereas in a gouty subject the deeper structures are involved and there is active hyperæmia which is transient and recurrent, and at times markedly periodic. Predisposition must, therefore, always be taken into consideration, and in every case of conjunctivitis full weight must be given to each of the three important factors: (a) the pathogenic micro-organisms, (b) the part of the conjunctiva primarily affected—the anatomical site, and (c) the constitution of the patient.

Active hyperæmia, which is the starting point of all conjunctival inflammations, is seen in its simplest form in the irritation produced by a foreign body—e.g., a particle of dust. The eye is red and waters, especially when exposed to the light, and winking causes a sharp pain; but there is no discharge, and the symptoms speedily disappear after the exciting cause has been removed. Should the irritant, however, remain, the conjunctivitis passes the stage of simple hyperæmia, the particular form the inflammation will assume depending largely on the behaviour of the discharge and other inflammatory products that are now developed. All the forms may, according to Meyer, be classed under one or other of the four following groups:—

"1. Simple hyperæmia of the conjunctiva, or hyperæmia accompanied by a mucous catarrhal, puromucous, or entirely purulent secretion. (Catarrhal, blenorrhœal, and purulent conjunctivitis.)

"2. The conjunctivitis in which the morbid secretion shows a tendency to become plastic, forming solid deposits either on the surface or in the thickness of the

conjunctival tissue—(pseudo-membranous and diphtheritic conjunctivitis).

"3. The conjunctivitis in which the secretion only takes place at certain places and elevates the epithelial layer in the form of pustules (phlyctenular conjunctivitis).

"4. Conjunctivitis in which the products of the disease take a special form, granulations, the anatomical nature of which is still a matter of discussion (granular conjunctivitis, trachoma)."

This classification, though now old, is the best of those of older date. The new classification is, as has been already said, largely according to micro-organisms, but, as the action of these is modified by anatomical site, and by the constitution of the patient, these factors require to be taken into account in determining the final grouping.

For clinical purposes we may, broadly speaking, divide cases into acute and chronic.

All acute inflammations are characterised by the presence of secretion which may be catarrhal, purulent, or plastic, but, however greatly the cases resemble one another clinically, bacteriological examination shows that the exciting micro-organisms may vary greatly. Catarrhal conjunctivitis, for example, is always associated with the bacillus of Weeks, subacute catarrhal conjunctivitis with the diplo-bacillus of Morax-Axenfeld, and purulent conjunctivitis with the gonococcus of Neisser.

In another group the inflammation is caused by the microbes, which are found in greater or less number in the conjunctival sac in its normal condition, and which do harm only under special conditions—the pneumococcus, the staphylococcus, and the streptococcus, the first two being specially prominent in epidemics among children, particularly after measles or any other of the exanthemata. Such forms of conjunctivitis are greatly influenced by the constitution of the patient, and if the child be scrofulous, or of scrofulous tendency, there is an efflorescence of papules on the bulbar conjunctiva. This, which is known as phlyctenular conjunctivitis, is neither more nor less than the expression of a diathesis, or, as Wright would put it, the indication of a low tuberculo-opsonic index—negative phase.

In still a third group—of which the most striking example is the plastic conjunctivitis associated with the Klebs-Loeffler bacillus, the staphylococcus, and the streptococcus—the special micro-organism acts only after the conjunctiva has become inflamed through the agency of the toxins manufactured by other microbes. Wherever, therefore, the clinical diagnosis is doubtful, a differential diagnosis can be made only through the recognition of specific microbes, and thus bacteriological examination comes to be a necessary complement to clinical study, and proves valuable alike in diagnosis, prognosis, and treatment.

In any variety of acute conjunctivitis the discharge is apt to become plastic and to form a false membrane, and, speaking generally, the appearance of a false membrane always indicates that the prognosis has become more unfavourable. It must, however, always be remembered that discharge may be rendered plastic and become adherent to the conjunctiva through the over-use of certain remedies—more especially alum and nitrate of silver—and that the membrane disappears at once when the use of the drugs is discontinued.

Care must also be taken not to confound membranous conjunctivitis with diphtheria of the conjunctiva, which is a disease that may not only destroy the eyeball but may even prove fatal. As it is not likely that I shall be able to show you a case I shall give a brief account of the symptoms. In diphtheria of the eyelids coagulation takes place within the tissues, thereby causing necrosis of the conjunctiva; while in the membranous or croupous form the exudation coagulates merely on the surface. The disease is seldom primary, usually reaching the eye by spreading along the tear-passages from the nasopharynx. It most frequently attacks children between the second and the eighth

year, and the prognosis is always most serious. In very severe cases, in which the staphylococcus and the streptococcus are found in addition to the Klebs-Loeffer bacillus, the eyelids are swollen, infiltrated, and brawny; they cannot be everted; and it is often hardly possible to open the palpebral fissure wide enough to see the cornea. A false membrane of ashy grey colour covers more or less completely the congested livid-red conjunctiva, and is so incorporated with the lids that it is separated from them only with difficulty, leaving the surface raw and bleeding. The membrane forms again with extraordinary rapidity. It spreads from the lids to the globe, and, in malignant cases, the destruction of the cornea is almost inevitable, and in addition, as a result of cicatricial contraction, the lids adhere to the eyeball and give rise to symblepharon, complicated by trichiasis and entropion. It is of the utmost importance, therefore, that the disease should be recognised at the earliest possible moment, and that, whenever an accurate diagnosis has been arrived at, antitoxin should be injected. The lids themselves must be kept clean by the free use of a warm solution of permanganate of potassium or of sulphate of quinine, but nitrate of silver, so potent for good in purulent conjunctivitis due to the gonococcus, ought not to be employed, even in weak solution, until the false membrane has separated; and its use must be discontinued at once if the exudation threatens again to become plastic.

Diphtheria of the conjunctiva is the only form of conjunctivitis against which we at present possess a reliable antitoxin, but the bacteriology of conjunctival affections teaches us that effective treatment must be largely antiseptic in character. The older ophthalmologists had arrived at the same conclusion empirically, for the remedies most frequently employed by them were nitrate of silver, sulphate of zinc, and perchloride of mercury. Our present fuller knowledge serves not only to corroborate the opinions arrived at by our forefathers, but also explains to us how it is that these drugs act so beneficially. Perchloride of mercury is inimical to all forms of microbic life, and, although the conjunctiva will not tolerate solutions of sufficient strength to kill the microbes, yet the drug undoubtedly moderates their activity, probably by altering the protoplasm so that, their food supply being seriously diminished, they speedily degenerate and die. We now know also that the bacillus of Weeks and the gonococcus of Neisser are speedily killed whenever they are brought into contact with solutions of the salts of silver, while the diplo-bacillus of Morax-Axenfeld is at once destroyed by a weak solution of sulphate of zinc. In addition to the use of those specific remedies, non-irritating sterile solutions must be freely used to sweep from the conjunctival sac all the micro-organisms which it contains; and this mechanical cleansing is perhaps of even more importance than the application of any special antiseptic.

Most forms of acute conjunctivitis if left to themselves, or if unskilfully treated, are apt to become chronic, and to persist for an indefinite time; and so the clinical distinction between the acute and the chronic forms may be said to be that in the latter the symptoms are much less intense and the progress is much more protracted. Take, for example, the most sensitive part of the conjunctiva, the palpebral portion. This is very apt to become chronically inflamed and thickened in those whose occupations expose them to the action of dust or of any chemical irritant, and the process will, if left unchecked, go on till a condition of ectropion is developed. The eversion of the lid causes displacement of the inferior punctum, and so the tears are not carried away by the proper excretory channels, but overflow on to the cheek. The epiphora thus induced serves to perpetuate the inflammation and to render its treatment all the more difficult.

The characteristic objective feature of all forms of chronic conjunctivitis is hypertrophy of the layer of adenoid tissue which is always present more or less abundantly in the normal conjunctiva. When the inflammation confines itself chiefly to the retroarsal

folds this adenoid tissue becomes collected into heaps called follicles. These, which are round, pinkish, translucent bodies, about the size of a pin-head, projecting from the surface of the conjunctiva, and arranged in rows parallel to the border of the lid, occur mostly in the lower retroarsal fold where they are rarely visible till the lower lid is everted. If, as sometimes happens, the inflammation extends to the palpebral conjunctiva, they will be accompanied by catarrhal discharge. In the most typical form of follicular conjunctivitis, however, there is but little redness of the eye, and the chief symptoms are sensations of itching and heat, and difficulty in seeing to read or sew by artificial light. The disease occurs for the most part in children at school and usually both eyes are affected. It arises most frequently and may even become epidemic through overcrowding and bad ventilation; but an acute attack may be excited by the long-continued use of either atropine or eserine. It always runs a prolonged course, is very liable to relapse, and undoubtedly predisposes to attacks of other forms of conjunctivitis.

Another form of follicular inflammation is spring catarrh, but this I must be content to illustrate by lantern slides, as, owing to the rare occurrence of the disease in this country, it is very unlikely that I shall be able to show you a case. Though spring catarrh was first mentioned by Arlt in 1846, and was several times afterwards referred to by other observers, it was not till 1876 that Reymond gave the first anatomical description of it. Occurring during hot weather, not contagious, and never epidemic, it assumes two forms—(a) bulbar, to which any cases recorded in the United Kingdom have belonged; and (b) tarsal, which is the type most common in Italy. In the former variety there is usually a reddish or yellowish tumour at the limbus on either the nasal or temporal side of the cornea. This growth is hard, movable, painless, and of uneven surface; and it may become confluent and surround the cornea with a cartilaginous collar. The tarsal variety affects only the upper lid, the conjunctival surface of which is closely studded with irregular prominences, bluish white in colour as if the epithelium had been brushed over with milk. There is little discharge, and as a rule the cornea remains transparent. The disease affects both eyes, runs a chronic course, and, though it subsides or even wholly disappears in autumn, almost invariably recurs on the return of hot weather.

Trachoma (which sometimes appears in an acute form, though it is oftener chronic) is a form of conjunctivitis which presents microscopic characters similar to those of follicular conjunctivitis, but is quite different from it in both anatomical site and clinical history. The conjunctiva, at first studded with granulations which later on pass into connective tissue, is ultimately converted into cicatricial tissue, which during the process of contraction, implicates the deeper structures of the lids, and thus produces deformity of the tarsal cartilage with inversion of the eyelashes. The corneal conjunctiva becomes affected by pannus, and severe cases end in complete conjunctival atrophy, so that the covering of the eyeball is dry, shrivelled, and cuticular, a condition described as *xerosis conjunctivæ* or xerophthalmia.

NOTE.—A Clinical Lecture by a well-known teacher appears in each number of the journal. The lecture in next week's number will be by Henry Jellet, M.D., Du'., B.Ch., F.R.C.P., Gynaecologist and Obstetrical Physician, Steeven's Hospital, Dublin, Examiner in Midwifery in the Royal University, and the Royal College of Physicians; Ireland, on "Pelvic Tuberculosis."

Royal College of Surgeons, Ireland.

At a meeting of the President, Vice-President, and Council, held on May 22nd, the following examiners were elected:—Physiology and Histology (Courts A. and B.)—Messrs. D. J. Coffey and E. L. Ledwich. Engineering and Architecture (Court A.)—Mr. C. J. Powell. Dutch (Court A.)—Mr. J. A. L. Hahn.

ORIGINAL PAPERS.

THE EARLY OPERATIVE TREATMENT OF APPENDICITIS.*

By DENIS KENNEDY, F.R.C.S.I.,

Surgeon, Jervis Street Hospital, Dublin; Surgeon Children's Hospital, Dublin.

It is quite usual to read in surgical text books, and in medical journals elaborate accounts of the indications for operation in appendicitis. The condition of the pulse, the temperature, and the tongue, the position of the legs and numerous other signs and symptoms are all enumerated to show when we should operate; and usually, as a final touch to the picture, the writer gives us a couple of special signs which when present always make him recommend operative procedure. And all this forgetful of the fact that no two cases run on exactly parallel lines. In consequence we cannot wonder that the ordinary practitioner is confused as to the course he should adopt in these cases, and that there is a fixed idea in the minds of the general profession that operation in appendicitis should only be carried out when the patient is on the brink of the precipice, that it is exceptionally dangerous, and that every effort should be made to bring the patient to convalescence without it. I am of opinion that the subject ought to be viewed from quite a different standpoint; and that once the disease is diagnosed, that in itself ought to be quite sufficient to have operation carried out. I refer, of course to true acute appendicitis and only to the acute condition, throughout my communication. I do not say that every case of appendicitis must be operated on to save the patient's life, but I do say that the results of early operative treatment are much better than those at present obtained by what is called the expectant treatment. This is the opinion held by the large majority of the best surgeons in America, and by many Continental surgeons of the highest repute.

Instead, therefore, of giving a long list of symptoms that call for operation, I would give two or three conditions that are opposed to it. First, when a patient cannot be operated on under favourable circumstances, and by someone that knows how. Secondly, when the patient is practically moribund; and thirdly, when some visceral lesion is present, such as bad heart disease, which would contraindicate any operation whatever.

I can imagine some ten or fifteen years ago men laying down the law as to when operation should be carried out for intestinal obstruction or for strangulated hernia. I am old enough to have been taught that in the latter condition taxis was first to be tried, then a hot bath until the patient nearly fainted, then taxis, then an anæsthetic, and finally taxis while the patient was under the influence of the anæsthetic. If the hernia were not then reduced, and the patient happened to be alive, the question of operation should be discussed. No wonder the mortality was high, either with or without operation. Pretty much the same idea at present prevails with regard to the treatment of appendicitis. When the circumscribed inflammation becomes diffuse, when the localised abscess bursts into the general peritoneal cavity, when the appendix is sloughing; in short, when the patient is in the worst possible condition for operation, and when the difficulties to the operator are almost insurmountable, then and not till then are we to attempt to get rid of the offending organ. Consequently the duration of this most painful illness is anything from three weeks to as many months, and the mortality is said to be from 20 to 25 per cent. With early operation the duration of the illness will be exactly eight days, and the mortality nil. Besides, we do not expose our patient to any unnecessary procedure. We are all, I think, agreed that once a person gets an attack of appendicitis, if not operated on

during the attack, and should he survive, he must be operated on afterwards to prevent a recurrence.

There is a widespread notion in the profession, even among operating surgeons that opening the abdomen during an attack of appendicitis is particularly dangerous. This I believe to be a complete fallacy. During the last two years I have operated on 43 cases of acute appendicitis. The illness previous to operation varied from eight hours to about three weeks; the pathological conditions found were anything from simple appendicitis to gangrene of the appendix with diffuse peritonitis; the ages of the patients ranged from three to seventy-one years, and I have not had a single death. If operation is carried out before complications have arisen, appendectomy during an attack is just as safe as during the quiescent period, and when complications have arisen, such as peri-appendicular suppuration, operation is no longer a matter of choice, but a matter of necessity.

Most of us are usually able to diagnose appendicitis when it occurs. None of us can tell what pathological conditions may be present or ensue during the attack. Diffuse peritonitis, formation of secondary abscess, sloughing of the appendix, intestinal obstruction, any or all may ensue from what was originally a mild attack, and we may have very little proof of their occurrence till it is too late for our patient. To show the futility of expecting some cases to get well without operation, and to illustrate the dangers to our patient there may be in delay, with your permission I will give a brief history of some of the cases I have operated on.

CASE 1.—Master E. F., *at.* 10, I saw on Monday, December 17th, 1905. He was ill from the previous Friday, had persistent vomiting, and continuous pain diffuse over the abdomen, but worse over the right iliac fossa. No motion of his bowels had occurred for three days, in spite of large quantities of purgatives, and an enema that had been administered, and only one ounce of urine had been secreted during the previous 24 hours. His abdomen generally was distended and the muscles over the right half were very rigid. The temperature was 101, and his pulse rate 110. I diagnosed appendicitis with ensuing ileus, and recommended immediate operation. Both the diagnosis and the treatment recommended were agreed to by my colleague, Dr. Savage, whom I asked to see the patient with me in consultation. The boy was sent to a nursing home, and I operated that evening, Mr. Tobin kindly assisting me. I found the inflamed appendix twisted like the letter *v* behind the cæcum, and so firmly fixed by adhesions that the lower end of the cæcum was bent backwards and upwards almost at right angles. The ileum was distended. On removing the appendix the cæcum resumed its normal position, and flatus at once began to gurgle through. There was some pus, and a good deal of serous and plastic peritonitis in the neighbourhood, especially over the small intestine. I wiped away the pus, provided for drainage, and the boy made a rapid and complete recovery.

CASE 2.—Frances B., *at.* 5. I was called to see on August 2nd, 1905. She was suffering from a typical attack of appendicitis. Two days subsequently Dr. Savage saw the case with me in consultation. The question of operation was discussed, but the child's mother strongly objected. As the disease seemed to be running a normal course, and as there were no urgent symptoms, we consented to wait, and adopt the treatment of masterly inactivity. Nothing of consequence happened until the night of August 5th, when the child suddenly collapsed, her temperature suddenly falling from 102 to 96. When I saw her in the early hours of Sunday morning her condition was one of extreme collapse, with its associated symptoms. There was no longer any question of postponing operation if the child was to get the least chance of recovery. Dr. Savage again saw the case in consultation, and agreed as to its urgency. On account of the patient's condition she could not be removed to a private hospital, and consequently I had preparations made as

* Paper read at the meeting of the Surgical Section of the Royal Academy of Medicine, February, 1906.

quickly as possible for operation in her own home. On opening the abdomen by an incision over McBurney's point, I had the greatest difficulty in finding the appendix. I prolonged the incision upwards in front of the kidney, as a mass was to be felt in that region. I found a gangrenous appendix, lying in a quantity of faecal pus, along the posterior wall of the caecum. On removing the debris, which included some faecal pellets, the outer coat of the posterior wall of the caecum ruptured spontaneously, to the extent of about an inch. I attempted to suture both the appendiceal opening and the rent, but no suture would hold. I greatly feared sloughing of the caecum would ensue. I had to content myself with wiping away the pus and debris as well as possible, and packing the parts with iodoform gauze. I made a counter opening in the loin and provided for drainage both through the loin and anteriorly. Nutrient enema kept the child alive during the next 24 hours, then she began to take nourishment by the mouth. No motion of the bowels was allowed for the first five days on account of the bad condition of the caecum. The child made a perfect recovery, and has not even a ventral hernia, as sequelae I was much indebted to the able assistance of Dr. Savage, during and subsequent to the operation, in bringing this case to a successful issue.

CASE 3.—Miss M., æt. 28, I sent to Jervis Street Hospital in June, 1904. She suffered from a well marked attack of appendicitis, and had been ill for 24 hours. I kept her under observation for a couple of days, carrying out the usual expectant treatment. She did not improve, and on the evening of the third day of her stay in hospital her temperature reached 105 after a pronounced rigor. I operated on the following morning, after a consultation with my colleague, Dr. Thompson. The appendix was greatly inflamed and distended, and there was well marked evidence of general serous peritonitis throughout the whole abdomen without a trace of any adhesion whatever. In a few hours more I have no doubt the abdomen would have been filled with pus. I removed the appendix, flushed out the abdomen with normal saline solution, and provided for free drainage. The patient made a complete recovery. Through my delay in operating, which was due to the prevalent practice, I nearly sacrificed my patient's life.

CASE 4.—Mrs. B., æt. 71, was sent to me to Jervis Street Hospital by my colleague, Dr. Savage. Six years previously she had an attack of appendicitis, from which she recovered, but a swelling about the size of an orange remained in the right iliac fossa. It did not cause her any trouble, and consequently she refused operation. On a Tuesday morning as she was getting out of bed, she felt something give way in her abdomen, and pain and vomiting quickly ensued. She developed intestinal obstruction, with peritonitis, and although urged to operation by Dr. Savage, she refused until the following Saturday morning, five days after her attack beginning. When I saw her in hospital she was in a semi-comatose condition, with all the appearance of approaching death. I carried out operation at once, making a long incision over the appendiceal region. The abdomen was filled with pus and there was no attempt at any limiting adhesion. I quickly removed the appendix and provided for free drainage. I neither douched, or in any way attended to the toilet of the peritoneum, for the simple reason that any delay would cause the patient's death on the operating table. For 48 hours the dressings were constantly saturated with pus. Her bowels acted the day after operation, and she made a slow but good recovery, leaving hospital eight weeks after operation, with no sequela, only a fistula from the peritoneal cavity.

CASE 5.—A young girl, æt. 22, was admitted to Jervis Street Hospital, April, 1905. Twenty-four hours previously she attended the out-patient department complaining of some abdominal pain; she refused to be examined and consequently was not prescribed for. She returned to her home; pain continued through the

day and night, associated with vomiting. The following morning she collapsed and was brought to hospital in the ambulance. I saw her, in consultation with my colleague, Mr. Byrne. We diagnosed perforating appendicitis, and carried out immediate operation. The whole region around the appendix, and the pelvis, was filled with faecal pus without any limiting adhesions. The appendix was intensely inflamed, and perforation had occurred through the caecum, half an inch from the base of the appendix. I sutured the perforation, removed the appendix, wiped out the pus and debris with gauze sponges wet with hot saline solution, and provided for free drainage. I used no douche whatever. She made a good recovery.

CASE 6.—Mr. S., æt. 56, I saw in consultation with Drs. Savage and O'Carrol in August, 1905. Patient was six days suffering from appendicitis, and a large swelling was present in the right half of the lower part of the abdomen. He had been a liberal drinker, and suffered from fatty degeneration of the heart with congestion of the lungs, liver and kidneys. Albumin was present in the urine in quantity. We were unanimous as to the gravity of the case, but the difficulty was to find a solution. The condition of the patient's abdomen demanded operation, his general condition was totally opposed to it. On the advice of Dr. O'Carrol we decided to wait for 24 hours in the hope of improvement supervening. That night the patient had rigors, and his condition next day was decidedly worse. Consequently I carried out operation, being assisted by Mr. Tobin and by Mr. Keegan, who gave the anæsthetic. I incised over the appendiceal region, and evacuated a large abscess from between coils of small intestine, and from behind the caecum. The suppuration was limited by marked adhesions, I could only have removed the appendix with great difficulty, and a prolonged operation; I therefore contented myself with wiping out the pus, and providing for free drainage. The patient made a good but protracted recovery under the care of his physician Dr. Savage, in spite of the fact that three weeks after his operation, he got an attack of profuse hæmoptysis, which was probably due to hæmorrhagic infarction of his lung. He is again to be seen vigorously prosecuting his business as a bookmaker at all the race meetings in Ireland.

CASE 7.—Mr. M., æt. 30, I was called to see at Camden Street, about 3.30 a.m. on the morning of November 23rd, 1905. The patient had gone to bed quite well on the previous night and awoke about 12 o'clock with violent pain in his abdomen. This

Showing appendix with constriction near the caecal end and a small perforation at the distal end, removed from Case 7.

was followed by vomiting. When I saw him he was quite collapsed, pain was severe, his legs were drawn up, and there was great tenderness and rigidity of the

muscles of the abdomen on the right side, particularly over the iliac region. His temperature was 102 and his pulse rate 115. I diagnosed fulminating appendicitis, and sent him at once to Jervis Street Hospital in the ambulance. I operated a few hours subsequently. On opening the abdomen by an incision crossing McBurney's point, pus was present everywhere without a trace of any limiting adhesion. I found the appendix enormously distended with a perforation half an inch from its tip, and through this perforation pus was flowing freely into the abdominal and pelvic cavities. I removed the appendix, wiped out the pus with gauze sponges, wet with hot saline, and provided for drainage. I used no douche. The patient made a rapid and complete recovery. This case is specially interesting from the fact that six months previously the patient had an attack of enteric fever which so closely resembled appendicitis, that a positive diagnosis could only be made with the Widal reaction. He also suffered from well marked mitral regurgitation.

With regard to the diagnosis of the disease it does not as a rule present any great difficulty, particularly in adults. Murphy of Chicago, lays special stress on the order of the occurrence of the symptoms. He says, "there is first abdominal pain, sudden and severe, followed by nausea and vomiting, general abdominal sensitiveness, elevation of temperature, beginning from two to twenty-four hours after the onset of the pain. These symptoms occur almost without exception in the above order, and when that order varies I always question the diagnosis." He also says "that temperature in acute appendicitis must always be present, and that it never precedes pain." I think this summing up of the symptoms is as near as we can get to a good guide for the early diagnosis of the normal illness in adults. Two symptoms that are often relied on for a diagnosis are very fallacious. First the right leg alone I have never seen drawn up even when an abscess was present. Both legs may be drawn up when diffuse peritonitis exists. Second, the most tender spot is not always McBurney's point, but varies according to the position of the tip of the appendix. The rectum, and in females the vagina, should always be examined, to determine whether pelvic suppuration is present or not; and no examination of a child is satisfactory without an anæsthetic. In children the diagnosis sometimes presents great difficulty as is illustrated by the following case:—

Baby K., æt. 3, suffered for five days from violent spasms of abdominal pain; there was no vomiting, no temperature, and only very slight constipation. During the intervals of the attacks of pain the child seemed well. On careful examination I found a thickening over the region of the appendix, and there was considerable tenderness present. The spasms of pain gradually diminished, the child's general condition improved, but the swelling and tenderness in the right iliac fossa seemed to get more pronounced. Consequently I recommended operation, which I carried out in the private hospital, 20, Mountjoy Square, assisted by Dr. Savage and Dr. Lewis Farrell. On incision over the appendiceal region, I found a large mass adhering to the anterior abdominal wall. To get into the abdomen I prolonged my incision upwards and was then enabled to separate the mass from the anterior parieties. I found the mass to consist of a very long thick appendix, with the distal half entirely enveloped by the omentum. I amputated the appendix, excised the part of omentum involved, and removed the whole mass together.

Professor McWeeney examined the specimen, and reported that it showed undoubted signs of having been the seat of repeated attacks of inflammation, while the part of the appendix and omentum matter together were on the point of breaking down into an abscess. The child made a rapid and complete recovery.

The incision I make for appendicectomy in acute cases is the one that crosses McBurney's point. I

avoid the muscle splitting operation, as I believe that its advantages are outweighed by its disadvantages. If the appendix is at all in an abnormal position, it may be difficult or impossible to find with such an incision, and if the incision has to be enlarged it takes considerable time.

Showing appendix enveloped by omentum removed from child, Baby K., æt. 3.

Our aim in operating ought to be two-fold. First remove the offending organ if possible. Second where peri-appendicular suppuration or exudation exists, free drainage should be provided for.

In some cases it is not possible to remove the appendix, however desirable if may be, without endangering our patient's life, especially where abscess exists. The manipulations necessary to free the appendix may cause serious injury to an inflamed bowel in the neighbourhood, or may carry infection to a wider area than was previously involved; or the condition of the patient may be such as not to be able to bear a prolonged operation. Fortunately its removal is not always necessary to save our patient's life. But convalescence will be more prolonged, suppuration will be more persistent, and consequently there will be much more risk of a ventral hernia ensuing. Besides, a focus of infection is left in the abdomen, which may give rise to trouble again either in the near or remote future. What is, however, absolutely essential is that where pus is present, whether localised to the neighbourhood of the appendix or not, free drainage must be provided for. I think on this largely depends the success of the operation as a life-saving means. I employ for drainage, a slit rubber tube with a gauze wick. I change the gauze as soon as it becomes saturated, as I believe once that occurs it acts as a plug, not as a drain. We must remember that pus may be present in quantity from appendicitis, either in the pelvis or in the retro-cæcal region, and no signs of it appear when we open the abdomen. Consequently, if we have to search for a suspected abscess these are two most likely regions in which we may find it. Further, if pus is present free around the appendix, it will most likely have made its way to the pelvis. The question of drainage through the rectum or vagina must then be considered. I have met with retro-cæcal appendicitis and abscess in four cases. The condition may be suspected if in connection with appendicitis there is a fulness and tenderness in front of the right renal region. In one of my cases, in a child already mentioned, the appendix was completely gangrenous and lay well up in front of the kidney. The points to be remembered in operating in those cases are:—First, we must

prolong our incision upwards, and secondly, to reach the trouble we must draw the cæcum and ascending colon towards the mid line. We can thus remove the appendix, get rid of pus, and establish free drainage through the loin or anteriorly without the least danger of the general peritoneal cavity becoming infected.

I am no believer in the extensive procedures that are sometimes carried out in cases where suppuration exists in connection with appendicitis. These consist in removing the appendix at any cost, in free manipulation of the intestine in excising every portion of the omentum that comes near the pus, in breaking down adhesions freely, and in douching, swabbing, and paying elaborate attention to the toilet of the peritoneum. I am thoroughly convinced that whether suppuration is localised or diffuse, the peritoneum is well able to look after itself, if it gets a fair chance by free exit being given to the pent up inflammatory exudate; and that where diffuse suppurative peritonitis exists, the quicker the operation is finished and the less manipulation there is of the intestines the better. Douching, if used at all, should only be employed when the fluid used can escape by a counter opening, as freely as it enters the abdomen, and when a large part of the abdominal cavity is infected. Under those conditions, it is certainly harmless except for the time it takes, but its benefit is a very doubtful quantity. Rough sponging injures the delicate endothelial lining of the peritoneum, and thereby tends to destroy its inherent power of resisting infection. I content myself with gently wiping away any pus that I find, with a gauze sponge wet with normal saline solution. I have practically given up the use of the douche altogether in these cases. I may say that although I originally adopted this line of treatment on account of the bad condition of a couple of patients, I find that I by no means am alone in recommending it. Senn long since has given up douching the peritoneum in peritonitis, and I may again be permitted to quote Murphy, of Chicago. He says: "I am convinced that the great mortality which has been reported of operations in the second stage (of appendicitis) have been due in a measure to excessive manipulation, sponging, flushing, &c. I am a strong opponent of lavage of the peritoneum."

In conclusion I may say—

(1). The dangers of operating during an acute attack of appendicitis have been greatly exaggerated, and with proper care are mostly imaginary.

(2). When suppuration is diagnosed, operation should not be delayed in the hope of adhesions being formed, and the pus becoming circumscribed.

(3). Children who get the disease usually have to be operated on for recovery.

(4). Our motto in treating the disease should be: "Leave nothing to chance." Consequently have the appendix removed as early as possible.

I owe an apology to the members of this Section for bringing such a well-discussed subject before them, and for my inability to treat it in a communication such as this in anything like an exhaustive manner.

THE SOURCES OF FAT IN MILK.

By E. F. WILLOUGHBY, M.D., D.P.H.

THE commercial value of milk for the manufacture of butter and cheese depending almost exclusively on the percentage of the fat, and its dietetic value, especially in the rearing of infants, being equally affected by the relative proportions subsisting between the other constituents and this, which is the most uncertain and variable of all, it is obviously to be desired that we should seize every opportunity of learning something of the sources whence the fat is derived and the means, if any, by which its production may be maintained or increased. Dr. Engel (*Arch. f. Kinderheilkunde*, B. XLIII, H, 1-4, 1906), assistant to Dr. Schlossmann, of the Dresdner Säuglings-

heim, with this view undertook a course of experimental feeding of nursing mothers. Proceeding on the assumption that not only the ancient notions of the derivation of the milk fat from the breaking up of the gland cells and of body fat from the metabolism of carbohydrates, but also the Munich doctrine that fat was produced by a "splitting" of the molecule of albumen, the carbohydrates acting indirectly are "sparmittel," and, as more convenient fuel were untenable, he looked to a simple transfer of the body fat from its subcutaneous deposit, or to the fat contained in the food. To verify the latter source, he employed a fat which should betray its presence in the milk by its high iodine number, oil of sesame presenting the greatest advantages, and gave it in daily doses larger or smaller for about a month to nursing women, some of whom were abundant and others scanty milkers. The effect of the oil on the milk fat in the raising of its iodine number was noted every three or four hours, instead of on the mixed milk of the whole day, as by previous observers, enabling him thus to follow it till the complete elimination of the foreign fats. It rose in every instance from a normal of 40 or 45 until the curve reached its highest point in a few hours, when it slowly sank. Women with an abundant secretion could, he found, completely eliminate every trace of 100 grams within twenty-four hours, whereas those with less active breasts required a proportionately longer time—thirty-six to forty-eight hours, or smaller doses, the smallest quantity given being 15 grams, but even this showed itself in a similar curve, though not rising so high and subsiding sooner. The influence of these meals of fat on the actual percentage of fat in the milk could not be made out, but it was certainly in no way detrimental to the quality of the milk or the health of mother or child. With a view to determining the influence of the fat in the food on the secretion of the breast, he put several women—good milkers—on a diet specially poor in fats, in fact, that prescribed by Rosenfeld for the cure of obesity, consisting of potatoes, green vegetables and fruit, lean meat, poor cheese and indifferent beverages given freely. After fourteen days, though the women had lost weight more or less, their health was good, the yield of milk was unaffected, and the percentage of fat not appreciably so, so that their infants thrived as before. Within two days, however, of the commencement of the new diet the iodine figure rose and remained constantly high until the resumption of the normal diet, showing the different source of the fat, viz., the tissues in place of the food, remaining, however, as sensitive as ever to changes in the diet in the form of an occasional meal with oil of sesame. From these observations one may safely conclude that the milk fat is derived from two sources—the body fat and the food fat; that the latter is the more easily utilised, but that when it is withheld or reduced, recourse is had to the former, and that the increase of the milk fat by a liberal allowance of fat in the food is practicable within narrow limits only, though within these limits it is not only prompt but lasting. It would be well to examine the relation and behaviour of the unsaturated fatty acids in connection with the green and mucous stools which Gregor associates with a low percentage of fat in the mother's milk, and also the importance of fat as a vehicle for bodies capable of solution in or combination with the fats, as iodine

and bromine, and probably many more. Some of these might be used therapeutically, but the nitrogenous dye, "Sudan III," having been known to be so abundantly excreted as to stain the cream a deep rose, it is very probable that many of the gastro-intestinal derangements of infants might be traced to the excretion of organic poisons ingested by or secreted in the maternal organism. Auto-intoxication is a recognised cause of disease, and no doubt it may be carried a step farther in the poisoning of the infant through its mother's milk.

THE OUT-PATIENTS' ROOM.

MERCY HOSPITAL, CORK.

Case of Congenital Cardiac Disease.

UNDER THE CARE OF D. J. O'CONNOR, M.A., M.D.,
M.R.C.P.I.

The patient was a male child, *æt.* 2. The appearance of the patient at once suggested the nature of the case. For while the child did not appear to be suffering from any acute disease, and looked bright and cheerful, the cheeks, lips, tip of the nose, and ears, were deeply cyanosed. The nails were of an even deeper livid hue, and the terminal phalanges of the fingers and toes were clubbed to a greater extent than I have ever noticed in any other disease. The rest of the body was normal in colour.

The mother stated that the child was "very blue" when born, and that this lividity had persisted in the parts referred to. It was increased by any exertion, but was especially marked when the child coughed or cried. The child also seemed to be very short of breath when it underwent any exertion, such as even walking a few steps. In other respects, however, it enjoyed good health, and had never been really ill in the ordinary sense of the word.

On examining the chest the area of cardiac dulness was found to be increased on the right side to a slight extent, the percussion note over the lower end of the sternum being dull. The apex beat was normal in position. Over the base of the heart a loud systolic murmur could be detected, this being better heard over the pulmonary than over the aortic area. A similar murmur could be heard over the apex, but this was evidently transmitted from the base, as its gradual diminution in intensity could be traced from base to apex. No thrill could be detected over any portion of the cardiac region. An examination of the blood revealed a moderate degree of polycythæmia, the red blood corpuscles numbering 5,600,000 per cm. A film preparation of the blood showed no abnormalities. The white blood corpuscles showed no change in quantity or quality. After examining the patient on two or three separate occasions, I formed the opinion that the case was one of congenital stenosis of the pulmonary orifice. It must be admitted, however, that the differential diagnosis of the various forms of congenital heart disease is a matter of exceeding difficulty. Their rarity makes it impossible for one to become familiar with their physical signs, and the errors of the wards have to be corrected in the *post-mortem* room. As, however, these various lesions do not differ materially in their symptoms or in their course, their recognition during life is a matter rather of pathological than of clinical interest.

OPERATING THEATRES.

ST. THOMAS'S HOSPITAL.

CASE OF APPENDICITIS AND OVARIAN CYST.—MR. EDRED CORNER operated on a girl, *æt.* 16, operated on in November, 1903, for a large appendix abscess on the right side of the abdomen. A fortnight after the

first operation another large abscess was opened on the left side and a faecal concretion removed from the track of the former abscess. Four days after the opening of the left abscess, she got a faecal fistula, which closed in a few days; in all probability, Mr. Corner thought, it was connected with the small intestine. The case, he said, was one of considerable interest at the time, and was recorded in his Erasmus Wilson Lectures. Since this illness she has got thinner, more easily tired, and her general health has been depreciated in many ways. Moreover, she had had at least three definite, one being severe, attacks of appendicitis. Examination showed both scars sound, no hernia; also tenderness in the right iliac fossa and in the pelvis *per rectum*. As he knew full well that the occurrence of suppuration in appendicitis by no means necessarily destroys the appendix, he advised the removal of the appendix. This was done in May, 1906, through an incision displacing the rectus inwards. The cæcum was adherent to the abdominal wall. The remains of the appendix, the distal half was merely a fibrous cord, were found internal to the cæcum. As is his rule in female cases, the internal appendages were examined, with the result that an adherent, blood-containing cyst was found on the left side. This was removed with some difficulty. Its wall showed signs of considerable inflammation and of some necrotic change. The abdomen was closed in the ordinary way. Mr. Corner said that before operation the case presented two problems of interest: (1) The condition of the appendix after two large abscesses had formed, and a large concretion had escaped from it. (2) What had happened to the adhesions round these abscesses. The operation he considered answered these: (1) The distal half of the appendix had been absolutely destroyed and the remaining part was very doubtfully responsible for her three "subsequent" attacks. (2) The adhesions had, to a great extent, gone, particularly in the pelvis, but to a lesser extent in either iliac fossa. In other words, they had disappeared from the more movable viscera, the small intestine, and remained around the less mobile, the large. But, he remarked, the case presented a further feature of great clinical interest. The solution of the clinical problem of her case was found in the pelvic viscera. He had pointed out over and over again the importance in every female case of appendicitis of examining these structures. Previously stress was laid on an examination of the *right* uterine appendages. In this case it was the *left* which were wrong. It was very possible that the development of the left ovarian cyst had something to do with the abscess on the left side opened in 1903. An abscess had formed in the pelvis, then tracked up by the rectum to the left iliac fossa. It must, he thought, have affected the left ovary on its way.

ROYAL SOUTHERN HOSPITAL, LIVERPOOL.

ACUTE PERFORATIVE APPENDICITIS.—MR. NEWBOLT operated upon a man, *æt.* 20, who on May 4th, 1906, was seized with pain in the appendicular region accompanied by vomiting, this being his first attack. Next day he was able to work, but at twelve noon on May 6th the pain became agonising. He was seen by Dr. Medwin later on, when his pulse was 120, his temperature 102°, and he was evidently very ill. The lesion was recognised, $\frac{1}{2}$ gr. of morphia given, and he was sent into hospital. On admission at 4 a.m. on May 7th, his pulse was 130, his temperature 100.2°, and his respirations were 36. His abdomen was slightly distended and was resistant to palpation all over. There was an indurated mass in the right iliac fossa. The

abdomen was opened at 5 a.m., seventeen hours after his seizure by an incision low down near the anterior superior spine of the ilium. The gangrenous appendix perforated at its base came into view, and was removed together with some gangrenous omentum. A little foul blood-stained fluid escaped. On further examination it was found after breaking down some adhesions with the finger, that sero-pus escaped from the pelvis, and from the right flank. An attempt to get rid of the fluid by dry sponging was made, but it was evident that the whole abdominal cavity was infected, and so much free fluid escaped from different regions in the abdomen that it was thought better to wash out freely. Glass tubes were inserted in each flank and above the pubes into Douglas's pouch. The irrigator was applied through the abdominal incision and some gallons of saline solution at a temperature of 105° were washed through the abdomen until all ran clear. A large gauze pack was put in the wound and the glass tubes were lightly plugged with gauze. The patient left the table in a very collapsed condition, but rallied gradually under the influence of free stimulation, strychnine, and saline injections. Mr. Newbolt did not consider that cases in which the abdomen was full of sero-purulent fluid could be treated by any one plan. That is to say, there were cases in which dry swabbing was indicated, and others in which free lavage only could be of service. In this case it seemed hopeless to get the fluid swabbed out, and as the whole cavity was flooded with sero-pus, no fresh infection could arise from the method adopted.

In those cases in which the mischief was localised, Mr. Newbolt said he never used irrigation, but trusted to dry swabbing and a free drain. In a recent case of perforated gastric ulcer with escape of contents, the whole abdomen being soiled, free irrigation was carried out by placing one tube in the epigastric wound and another in the pouch of Douglas, saline solution was run through till all was clear, and cultivations of the fluid from the tubes proved sterile for the three days during which they were retained, the patient making a good recovery. Mr. Newbolt insisted upon the necessity of immediate operation in all cases in which patients with appendicitis complained of this acute agonising pain; he considered that it was nearly always due to perforation of the appendix, and the fact that this youth, when admitted at 4 a.m. was comparatively comfortable was due to the morphia which had been given, and would have been most misleading had not the practitioner in attendance warned the surgeon of the true nature of the case. In this instance nature had not been able to shut off the general cavity of the peritoneum above and below, though she had made a bold attempt by wrapping the omentum around, but this also was infected by the disease.

Vomiting was troublesome for two days; the glass tubes were removed from the loins in forty-eight hours, and from above the pubes on the third day, gauze only being substituted. Some discharge took place from the wound in the appendicular region. The patient eventually made an excellent recovery.

TRANSACTIONS OF SOCIETIES.

EDINBURGH MEDICO-CHIRURGICAL SOCIETY.

MEETING HELD JUNE 6TH, 1906.

Dr. J. O. AFFLECK, President, in the Chair.

Dr. W. T. RITCHIE showed (for Dr. Gibson) a case of "Symmetrical Trophic Lesions of Both Thumbs," without definite symptoms of syringomyelia.

Mr. DAVID WALLACE showed a patient after cholecystectomy for "Septic cholangitis." The history was that for a week previously she had suffered from acute abdominal symptoms, with fever, and that on examination there was tenderness and resistance over the right hypochondrium, where, on palpation, grating friction, indicative of perihepatitis, was felt. The diagnosis of cholangitis was made, and on opening the abdomen the greatly distended gall-bladder was exposed. It was punctured, and fluid with the odour characteristic of infection with *b. coli* was withdrawn. Thereafter the gall-bladder, containing a number of calculi, was excised. In these cases there was great danger of infecting the peritoneum, and special care had to be taken to shut off the cavity by packing round the gall-bladder with sponges before removal.

Mr. STILES showed two children after operation for HIRSCHSPRUNG'S DISEASE.

The condition, which was also known as congenital dilatation of the colon, was named after its describer, and the symptoms were obstinate constipation from birth associated with enormous distension of the abdomen. The superficial veins on the abdomen were dilated, the lower aperture of the thorax was greatly widened, and from time to time waves of peristaltic movement could be seen passing over the belly. The first case had come under observation four years ago, when the child was *æt.* 5, and was in all respects typical. Never since he was born had the boy had a natural

motion, enemata having always been required in order to keep the bowels open. The child was in extremely poor condition—emaciated, and with deep hollows under the eyes. On opening the abdomen in the left iliac region the colon presented; it had exactly the appearance of an adult stomach. As the state of the patient precluded any extensive operation, colostomy was performed, the mucous membrane of the gut being sutured to the skin so as to make a permanent artificial anus. Two years later the child was brought back to hospital for the purpose of having the artificial anus closed if possible. On opening the abdomen in the middle line the colon was found dilated to the size of a man's thigh. As nothing radical could be done, the wound was closed. The child now was in good health and well nourished; his bowels moved daily through the artificial anus, but the intestine between the artificial anus and the rectum was found to be loaded with impacted fæces. On the whole, the result was good, because these cases had almost invariably proved fatal. In the second case, operated on about three weeks ago, the typical symptoms and signs had also been present. The operation had consisted in anastomosing the ilium to the pelvic colon, so that fluid, instead of solid fæces, might enter the rectum. The disproportion between the size of the colon and the small intestine was so great as to make anastomosis difficult, and although prior to the operation every effort to wash out the colon had been made, it was found to be loaded with fluid and semi-solid fæces. After operation some anxiety was felt lest the distended bowel should press on the lumen of the anastomosed ilium and cause obstruction, and, in fact, there were some signs of this for several days. The patient had made a good recovery and now was running about quite well. In this case the hypertrophy and dilatation was limited to the descending and pelvic colon, and this was the condition usually met with. It was a

matter of dispute whether Hirschsprung's disease was a primary hypertrophy and dilatation, whether it was due to stricture, or whether it arose in consequence of some functional derangement of the neuro-muscular mechanism of the colon comparable to what has been supposed to be the case in congenital hypertrophy of the pylorus. Probably some cases of volvulus in adults, preceded by years of constipation, were of the same nature as the condition described.

Dr. G. A. GIBSON showed a series of tracings from cases of heart-block.

Mr. CAIRD showed four examples of intestinal carcinoma removed from the pelvic colon and rectum.

Mr. WALLACE showed Gall-bladder and Calculi from case of septic-cholecystitis.

Dr. AITCHISON ROBERTSON exhibited a new antidote and emergency case containing appliances for coping with cases of accidental or suicidal poisoning, &c.

Dr. DAVID WALLACE read a paper on "Tumours of the Bladder: Why Operative Treatment is so Frequently Unsuccessful in its Remote Curative Result. A Plea for Early Diagnosis," which we hope to publish in our next.

Mr. CAIRD, in discussing the paper, suggested that in future it might be possible to perform more radical operations on the bladder, now that it was known how tolerant the rectum was of implantation of the ureters. There was apparently no reason why the whole bladder should not be removed, and the ureters brought out to the skin or implanted into the colon. Possibly the cæcum might be employed to form a new bladder.

After some remarks by Mr. Miles, Mr. WALLACE, in replying, mentioned a case in which the bladder had been removed, the ureters led into the cæcum, and the appendix converted into a species of urethra. Whatever was the pathological explanation of the recurrence of apparently benign tumours, it was only common-sense to suppose that the likelihood of this would diminish with early removal.

Dr. A. H. H. SINCLAIR read a paper on THE EARLY DIAGNOSIS OF GLAUCOMA BY THE SCREEN TEST (BJERRUM'S METHOD).

In Bjerrum's method of testing the field of vision the principle of using a white object against a black background is employed as with the perimeter, but with important differences. In the perimeter the test object employed subtends an angle of $\frac{1}{2}$ a degree, and when the test is reduced below this size the field of vision becomes restricted accordingly. Bjerrum employs very much smaller test objects, with the intention of testing the state of vision *within* the full perimetric limit of the field. With the perimeter the defects found in the field are said to be absolute; with Bjerrum's test defects found are called relative, because when a larger test object is employed over the same area vision can be excited. In making Bjerrum's test the absolute limits of the field are first determined by the ordinary perimeter, and then the state of relative vision within this field is examined by a small white test object used at a distance of one or two metres against a large black screen. The distance at which the patient is placed has the two-fold effect of increasing the eye to which scotomata are projected and therefore making them more easy of delimitation, and, second, of reducing the visual angle of the test object. The apparatus consists of a large screen of black velvet, having marked out on it in black thread radiating lines and concentric circles. To obviate the need for so many threads, Dr. Sinclair employed a rod with a scale engraved on it for either one or two metre distance, which was placed along the radiating lines and thus marked out the position of the test object, without the concentric circles of thread being required. The various precautions necessary in working with the test were then described, and fields of normal eyes taken by the method were shown. In using the smaller test objects the effect of retinal fatigue must be remembered. The distinctive characteristic of the field in glaucoma, which has been referred to as Bjerrum's symptom, depends on the relationship of the area over

which vision is most fully presented to the area of relative deficit, and may be stated as follows:—The area of most acute vision, as also of relative defect, are in contact with the blind spot, or may be said to meet at the blind spot. When scotomata are present they frequently occupy a paracentral position forming an arc round the fixation-point, the concavity of the arc being towards the fixation-point. Such scotomata never reach beyond the blind spot towards the temporal side, but may extend to the periphery on the nasal side. The form of the field characteristic of glaucoma appears with remarkable regularity in all cases. It is quite distinctive from the field found in optic atrophy. It is the earliest, and often the only demonstrable evidence of the presence of the disease. The paper was illustrated by numerous perimetric tracings, and tracings made by Bjerrum's test from a score of cases of glaucoma.

Drs. GEORGE BERRY and T. V. PATERSON concurred with Dr. Sinclair in his estimate of the great value of Bjerrum's test as an early sign of glaucoma. It was, however, a test which required considerable experience on the part of the observer to give reliable information, and was of no value when carried out by a tyro.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

SECTION OF MEDICINE.

MEETING HELD FRIDAY, MAY 18TH, 1906.

Dr. JAMES CRAIG in the Chair.

SUDDEN HEMIPLEGIA IN A CHILD DUE TO TUBERCULOUS CEREBRAL TUMOUR.

Dr. TRAVERS SMITH read notes upon the case of a male child, æt. 2½, who, upon January 1st, 1906, whilst in apparently perfect health, suddenly lost voluntary power in the right arm and leg. A fortnight later great rigidity appeared in the affected arm and leg. The right leg, and to a less extent, the left one, were drawn up in the intra-uterine position. On March 1, the child showed signs of tuberculous meningitis, and died upon March 6th. *Post-mortem*, tuberculous meningitis was found, and a large tuberculous tumour, the size of a hen's egg, was found to occupy the region of the corpus striatum and internal capsule. No hæmorrhage was visible in or around the tumour. Dr. Travers Smith considered the case interesting from the following points of view: (a) The large size of the tumour; (b) its position; (c) the power of a tumour to produce sudden hemiplegia in a child apparently healthy.

ARTIFICIAL RESPIRATION.

Mr. ROBERT WOODS read a paper on this subject, in which he compared the relative advantages of Sylvester's method with the older one of direct insufflation. He showed that by direct insufflation more air was introduced, and, therefore, the stimulating effect on the vascular and respiratory mechanisms as well as the rapidity of elimination of a drug such as chloroform was greater, while the impurity of the air insufflated (the original reason for abandoning the method) was negligible.

Professor THOMPSON said he agreed that Mr. Woods' ideas on artificial respiration were an improvement on the methods at present used, his only objection being the repugnance of placing mouth to mouth.

THE NAUHEIM TREATMENT.

Dr. A. AINSLIE HUDSON read a paper on this subject. He described the composition of the effervescing baths, and detailed his methods of artificially preparing these in Ireland. He then gave an explanation of the physiology of the improvements which follow the baths, and the exercises which accompanied them. The immediate effect of the application of the water, rich in salines, is to produce a powerful stimulation of the muscular coats of the superficial blood-vessels, an effect greatly enhanced by the presence of the CO₂. Dr. Hudson also detailed the technique of the treatment, and described the nature of the exercises the

patients performed, and indicated the nature of the ailments and the symptoms which could be cured or alleviated by the treatment.

The Chairman and Dr. Finny discussed the treatment, which they agreed was often beneficial.

CORRESPONDENCE.

FROM OUR SPECIAL CORRESPONDENTS ABROAD.

GERMANY.

Berlin, June 10th, 1906.

At the Medical Society, Hr. S. Munter spoke on THE HYDRO-THERAPEUTIC TREATMENT OF FEBRILE INFECTIVE DISEASES.

He first gave an historical review of the subject, and said that since the time of Brandt, hydro-therapeutic measures had been successfully employed against fevers, and particularly typhoid. Extraction of heat, however, even if it did play a part, was not the only active factor.

We knew now that rise of temperature supported the efficacy of the natural protective material of the organism, that the alkalescence of the blood rose with the gradual rise of temperature, but not with sudden rises. But experience taught that a very high or continuous fever was a grave danger to the organism. From this was to be extracted the teaching that only excessive or long continuous fever should be made the object of treatment.

The objects of fever treatment should be the diminution of heat production on the one side, and an increased giving off of heat on the other. The latter was more easily practicable than the former, and it was best done by bath treatment. Cold water spongings served for minor reductions of temperature, but in cases of high fever baths were more useful; but it must be remembered that these increased the production of heat and were of grave importance in cases of high fever, and the organism must be got accustomed to bear them, so the bath must be gradually cooled from 28° C. to 20° C. Cool douches, whilst in the bath, followed by friction, were to be recommended. For patients who got chilled easily carbonic acid baths were suitable. All these measures acted favourably on the heart and blood vessels, on the nervous system, and on the digestive organs. The better circulation was expressed by the increase in diuresis after the bath. In spite of this, the excretion of urea and uric acid fell because the stasis in the organs was raised and through this the tissue change was diminished.

At the Verein f. Innere Medizin, Hr. Plehn reported a case of

BLACK WATER FEVER.

The patient had lived a year and a half in Togo, and although he had taken quinine in prophylactic doses whilst there, he had suffered several times from malaria, and at last he got black water fever. The quinine was now stopped entirely when he had another severe malarial relapse. Euquinine was now given in $\frac{1}{4}$ gram doses. After three such doses the temperature rose, and after five doses black water fever came on. The patient now returned to Germany; he had attacks of malaria on board ship, but took no more quinine; he came to Berlin and put himself under the speaker's treatment. Examination revealed considerable enlargement of the spleen and slight liver enlargement. The question what one should do in such a case was a difficult one. If no quinine were given the malaria relapses would return; if no quinine were given the patient would die of complicated malaria; if quinine were given he would get black water fever. Here the mortality was not so high, however; it was, if the patient was under medical control, about 12 per cent. If in latent malaria quinine was given at once, black water fever might come on, but frequently it did not. This was the state of affairs in the colonies. If the patients came back to Europe, the disposition to the disease disappeared; sometimes even without quinine, but not by any means in all cases. In any case,

quinine must be tried, if the patient remained under medical treatment; if he insisted on leaving he should be sent into the country, to the mountains, to recoup. In the present case, in which no parasites were seen in the blood, quinine was tried. At 11 o'clock in the morning $\frac{1}{4}$ gm. of euquinine was given; two hours later the patient had a rigor with jaundice and vomiting; in short, a black water attack. With this there was almost complete anuria, only 25 ccm. were passed the first day; it contained a quantity of albumin and was of a deep black colour. The patient felt fairly well, but the day following only 17 ccm. of urine were passed, and in the days following from 30 to 70 ccm. Otherwise the improvement continued. With such a degree of anuria he had never yet seen a recovery. Here the disease ran a more favourable course, after copious subcutaneous infusions of saline solution, free washing out of the stomach, and infusions into the rectum with the same kind of fluid, diuresis was restored. Up to two litres of urine per diem were excreted, notwithstanding the large amount of insensible perspiration due to the hot weather. It was remarkable that there was no trace of œdema. The patient might now be considered cured. No cylinders were to be found in the scanty urine; epithelial tubules first appeared when the diuresis came on. During the course of the disease there was no hæmaturia, only hæmoglobinuria.

Hr. A. Fraenkel asked if methylene blue had been tried in black water fever.

Hr. Plehn said Yes; it had proved absolutely useless. It was the same with salipyryne, phenocoll, antipyryne, and similar remedies; they could even set up black water fever in tropical malaria.

Hr. Hans Kohn asked what Plehn thought of doing further for his patient as he still had his malaria.

Hr. Plehn replied that that was not certain, as not infrequently the parasites were destroyed after black water fever. He had sent the patient to Thuringia to recoup, with instructions not to take quinine, but to return at once on any reappearance of malaria.

AUSTRIA.

Vienna, June 10th, 1906.

INTRA-MURAL TUMOUR OF BLADDER.

HABERER presented a case to the Gesellschaft from whom he had removed a fibroid from the inside of the bladder.

The patient was æt. 30, and came to him in March, 1902, with inguinal hernia of the right side, for which he operated. In November of the same year he was operated on for hernia of the left side. At no time before this had the patient complained of pain in urinating or any other cystic trouble.

Fourteen days after the second operation he began to complain of a constant pressure in the region of the bladder with a smarting, burning pain on urinating. The patient had no fever at any time, but commenced to lose appetite and weight.

There was no history of venereal disease; the urine was clear, but sometimes contained traces of blood.

Palpation revealed a tumour to the right, and slightly above the symphysis pubis; a small round tumour about the size of a child's fist; a smooth surface and hard consistence. It was movable and not painful. The cystoscope revealed a round tumour about the size of a walnut projecting from the internal wall of the bladder. Above this tumour were two necrotic patches of the mucous membrane, which when touched very lightly commenced to bleed. The prognosis was rather gloomy as the symptoms pointed to a malignant fibroid originating in the wall of the organ. From the tumour towards the umbilicus a broad, fibrous band extended, which led to the presumption of a tumour having originated in the urachus and subsequently protruded into the bladder.

Bier's anæsthetic was applied, i.e., anæsthetising the spinal cord, and performing the Sectio-Alta removed the inflammatory tumour, from which proceeded a fibrous band upwards and toward the middle line.

On opening the tumour it was found to contain necrotic tissue in the centre bathed in sterile pus which communicated with the pedicle and required to be scraped out and cleaned before closing. Free drainage was succeeded by perfect recovery.

The inflammation seems to have been partially para-vascular and intra-mural in the production of the tumour, escaping in the direction of the least resistance. The proximate cause, he concluded, was the result of the operation for hernia on the right side, which was performed according to Bassini's method, which is to separate the seminal duct from the cord and, laying it in a channel of its own, external and at a higher level.

AN ORGANISATION FOR NURSES.

The Gesellschaft was seriously moved by the subject of nurses brought forward by Moskovicz, who seems to be bold enough to venture a raid on the Church. He proposes that all nurses should be educated on secular lines and fitted properly for their duty at the bedside. It may seem strange to English ideas that secularism cannot be tolerated in the teaching of nurses, but it must be remembered that the same anomaly exists in our own education. Moskovicz pointed out that Austria at the present time had only 4,237 nurses, while Germany had 24,000 Roman Catholic nurses and 12,000 deaconesses.

Billroth hoped when he founded the "Rudolfshäuser" twenty-five years ago, to have a perfect supply of nurses in Austria, but the restrictions have been so great as to destroy all the good anticipated. Why? he asks, when Germany, France, England, and America have an abundance and to spare of trained nurses. If war took place at any time with Austria, the hospitals would have to be closed or beg from other countries. He desired a central institution for teaching nurses as a profession and not as an auxiliary to religion, which confined nurses too much and destroyed the health.

Escherich concurred with the preceding speaker that we required nurses better trained with their hands in the arts of medicine and surgery.

Teleky and Exner hoped to see the ethical and educational status of this class raised by the formation of a proper society which should not be subject to the cloister.

HUNGARY.

Budapest, June 10th, 1906.

At the recent meeting of the Royal Society of Physicians of Budapest, Dr. Egmont Baumgarten exhibited a case of an affection of the accessory sinus of the nose associated with

PARALYSIS OF OCULAR MUSCLES.

He pointed out that chronic diseases of the sphenoidal sinus are usually accompanied by severe symptoms, and on account of its proximity to the eye it might entail serious consequences to that organ. In the patient shown a year ago was a complaint of much headache. Soon after he became unable to open the eyelid. Two months ago diplopia developed. Diseases of the antrum of Highmore and of the frontal and ethmoidal sinuses having been excluded, the headache and other severe symptoms led him to seek for the seat of the disease in the sphenoidal sinus, and he therefore made an opening into the sinus through its anterior lower wall. Ptosis and the protrusion disappeared on the following day, and the patient could move his eye better. Two days later, after the removal of the anterior part of the middle turbinal, Baumgarten scraped out the granulations lodged in the sphenoidal sinus. The patient felt very faint under this treatment, otherwise was quite well. The eye now moves inwards to the middle line, upwards only a little, downwards tolerably well. The posterior wall of the eye was intact. The patient denied having had syphilis, nor had he previously had any infective disease. This made it very difficult to assign the real cause of the affection. That the eye-muscle paralysis is dependent upon the sphenoidal disease appears

likely, and this view is confirmed by anatomical considerations; it is confirmed, moreover, by the result obtained.

FAT CHANGES IN THE STOMACH.

Dr. Gerber related his experiments on dogs with fat. After twenty-four hours' fasting they were provided with a meal of fat. Six hours later they were killed, and a weighed quantity of the contents of the stomach taken for analysis for free fatty acids. In one of the cases there was a decided increase of the free fatty acid, while none was observed in the other. He next took part of the mucous membrane of the stomach, and determined its power of breaking up fat in a test tube. He placed neutral olive oil in a portion of the stomach, and suspended it in a water extract; another portion of the stomach was suspended in glycerine extract and gently shaken for half an hour at 40° C. As a control experiment another portion of the stomach was boiled, and the olive oil placed in it in the same manner as the fresh experiments. The digestive power of the mucous membrane was then analytically tested with "petrol aether" and the free acid determined. The results were that the conversion into neutral fats as *in vivo* were very slow. The glycerine extract was quite inert as well as the mucous membrane of the second cut, as no ferment was found.

A CASE OF BANTI'S DISEASE.

Dr. Brajer brought before the notice of the Society the case of a young woman, æt. 23, who up till two years ago was perfectly healthy, but after this period began to gradually enlarge over the abdomen. Neither malaria nor syphilis had ever been present. A year ago the enlargement was diagnosed as a splenic tumour, whereupon arsenic was freely administered for a few months without success. More recently she complained of extreme weakness and pain in the back associated with palpitation.

On her reception into hospital a hard splenic tumour was easily palpated over the symphysis pubis in the middle line. The liver was slightly enlarged but smooth, with slight œdema of abdomen. No glandular swelling; accidental systolic murmur; lungs normal. The blood had 58 per cent. of hæmoglobin, 2,800,000 red corpuscles, and 1,800 white ones, or a proportion of 1,600 to 1. Beyond this leucocytosis there was a slight relative lymphocytosis. In the urine was found a large amount of urobilin and gall-colouring matter. There were temporary attacks of icterus in hospital, but under arsenic treatment the colour improved, but the tumour remained the same, although the blood changed. Hæmoglobin, 72 per cent.; red corpuscles, 7,000,000; white, 1,270; or proportion of 3,100 to 1. The complex symptoms with successive leukæmia pointed to an advanced form of Banti's disease.

FROM OUR SPECIAL CORRESPONDENTS AT HOME. SCOTLAND.

THE GLASGOW CANCER HOSPITAL.—The directors of this institution have just issued an appeal for funds on behalf of the proposed extension, and the establishment and equipment of a research department. The hospital has been in existence for about 15 years; it began in a small way in an ordinary dwelling-house, where there was subsequently established, in addition to an indoor department, an out-patient department provided with trained nurses who visited and dressed patients at their own homes. Some years ago the size of the hospital was increased by the erection of a building at 132-138 Hill Street, where excellent work has been carried on, not only among Glasgow patients, but among patients drawn from all over Scotland. While the primary object of the hospital is to treat medically and surgically cases of cancer, a very important secondary object—the establishment of a research department has been kept steadily in view. To place this on a proper footing so that good and useful work may be done, means a staff of special workers who

would require to be paid suitable salaries. Probably £1,000 a year would be needed. This seems a large sum of money, but such research work is better not carried out at all than in an improper and unscientific manner. The directors think a beginning might be made by securing the annual support of a number of subscribers for from 3 to 5 years, so as to give the research undertaking a trial. The directors, however, wish it clearly to be understood that the treatment of cancer in the hospital will be on the same lines as in all other infirmaries elsewhere. Under these circumstances, the directors appeal for £20,000 for buildings, and an annual guarantee of £1,000 for research. We learn that nearly £4,000 has already been collected, and that one of the most pressing needs for extension is the provision of small wards for patients advanced in the disease. Dr. Beatson, whose name is so well known in connection with operations for cancer of the breast, is one of the surgeons to the hospital.

PHTHISIS AT THE EDINBURGH CITY HOSPITAL.—Some time ago we referred to the proposal to admit advanced cases of pulmonary tuberculosis, which were serving as foci of infection, to a special pavilion in the Edinburgh Fever Hospital. Since this ward was opened in April, 21 cases have been admitted, of whom 8 have died. The last admission was on May 26th, since when there has only been one application. As the weekly mortality from phthisis is 13 or 14, the small number of patients seems to imply either ignorance on the part of those who were expected to benefit or indifference to the public health aspects of the question on the part of medical men. The Public Health Committee have accordingly taken steps to make their scheme more widely known to secretaries of dispensaries and others. Probably one potent cause of the small number of admissions is the natural desire of those who know that their time is short to die in the homes and among the relations where their lives have been spent.

EDINBURGH ROYAL INFIRMARY OLD RESIDENTS' CLUB.—The 12th annual dinner will take place at the Caledonian Station Hotel, Edinburgh, on June 29th, at 7 o'clock. Sir Lauder Brunton will be in the chair, and a number of old residents from distant parts of the county are expected to be present. Those who wish to attend are asked to send their names to Dr. Edwin Eramwell, 23, Drumsleigh Gardens, Edinburgh, not later than June 25th.

LETTERS TO THE EDITOR.

ISOLATION HOSPITALS AND SCARLET FEVER CASES.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—It appears to me that there is much to be said in favour of isolation hospitals, and I should like to cite a few cases which have recently come under my personal observation. I saw a child, æt. 6, about a month ago, who was suffering from scarlet fever. The father worked in some extensive works in the town, and the eldest son was a clerk in the same works. The house occupied by this family was small. There were eight children at home. The child was at once removed to the Isolation Hospital and no further case occurred. About the same time I saw the child of a carpenter, also suffering from scarlet fever. There were two other children at home. The parents refused to allow the infected child to be removed to hospital. The other children contracted the disease.

Again, if we take the case of a very mild case of scarlet fever, which is treated at home. Parents are apt to regard these cases as very unimportant, and among the poorer classes efficient isolation is practically impossible.

Let me cite another case—The child of a clerk contracted scarlet fever. The mother refused to allow her to be removed to the Isolation Hospital. There were two other children in the house. Judge of my annoyance when visiting the house two days after seeing

the first child, I found the other children playing with the infected child. "I thought that they were bound to get it," was the only reason given for this act of foolishness. It is not only the children who suffer, but often, doubtless, the disease is spread by the incaution of parents.

Then, again, in the event of an outbreak of scarlet fever among the poor, what a boon it is to the general practitioner who has also to attend midwifery cases, to be able to send these cases away, knowing they will be well cared for, instead of having to attend a number of them through a prolonged and tedious convalescence.

Finally, let us not forget the mortality. How poor are the chances of recovery in the case of the children of poor, ignorant and perhaps drunken parents in cases in which complications arise. How many more cases of nephritis would occur under such conditions, of otitis in cases in which the cleansing of the naso-pharynx was entrusted to incompetent or neglectful persons. I know that as a general practitioner. I have often blessed our isolation hospital when I have had several cases of scarlet fever occurring among my poorer patients at a time when I had an operation or confinement impending. Three weeks ago I saw a child with scarlet fever. The next door neighbour's child had scarlet fever, and had not been removed to the Isolation Hospital. My patient was removed at once, and although there were two other young children in the house no further case has occurred.

Isolation hospitals have certainly proved a boon to me and my patients, and doubtless other medical men have experienced the same advantages. Statistics are a vain thing to either condemn or uphold belief.

I am, Sir, yours truly,

Bedford, June 11th, 1906.

G. J. Ross.

THE TIMES AS CENSOR MORUM.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—In reference to your most praiseworthy attitude with regard to lay journals and quack advertisements, may I draw your attention to a leading article which appeared in *The Times* of Friday, June 1st? The writer lashes the Chicago meat packers with a whip of scorpions; and the question at once suggests itself—How can a newspaper consistently thus attack rogues in America whilst it supports no less heartless and injurious rascals at home. A considerable proportion of the advertisements and paid puffs in *The Times* emanate from men—medical quacks and quack medicine concoctors—who were formerly ranked by its editors among the criminal classes and denounced accordingly on every occasion.

If the proprietors of *The Times* will inquire, they will find that medical quackery in every form has now become the pursuit of a vast army of adventurers, who find in it a perfectly safe enterprise for the plunder of simple suffering humanity. They will find that quackery in many forms is used as a system of black mail, and that the lower class of advertising dentists and such impostors as obesity-curers and cosmetic quacks make their money by slightly veiled extortion from the foolish women for whom they especially lay themselves out. These men often merely pick the pockets of their victims; the more cruel and cynical scoundrels—such as cancer, rupture and venereal quacks—play a game involving questions of life and death. *The Times* managers can easily satisfy themselves that the statements of their editors to which I have referred with regard to the injury to the public health due to the quack medicine trade are more applicable at the present day than ever. Other quacks pursue their nefarious trade under the cloak of medical or electrical "institutes," and of drink-cure establishments, or under the mask of religion in the form of Christian science and esoteric Buddhism. *The Times* has it in its power to expose and to put an end to the whole hideous system. The vilest class of advertisements may not be discoverable in its columns, but so long as it admits the classes it now freely accepts.

it is impossible to expect inferior papers to draw a line. *The Times* does it, we cannot live without it; this is the reply of the small newspaper owner when appealed to. We have all been hitherto proud of *The Times*, and have regarded it almost as a magnificent national institution—a potent instrument in promotion of social progress and civilisation. It is truly deplorable to contemplate the destruction of the influence it might still continue to wield.

I am, Sir, yours truly,
HENRY SEWILL.

June 9th, 1906.

THE ALCOHOL QUESTION.

To the Editor of the MEDICAL PRESS AND CIRCULAR.
SIR,—At last these questions of Alcohol, Fermentation, Temperance, and the causes of intemperance are being dealt with on proper scientific principles, and it is only to be regretted that this was not done long ago.

Very little assistance has been given by the medical profession in this work, and it is right to draw attention to the fact that the MEDICAL PRESS AND CIRCULAR may claim to have some credit for the views expressed more than five years ago on the subject of Temperance and Legislation (Wed., Jan. 23rd, 1901).—I am, Sir, yours truly,

R. L.

THE CHRISTIAN SCIENCE QUACK.

SIR,—Your correspondent, "Denizen of a Back Street," plainly possesses the gift of generalising and of directness—two things that cannot fail to bring a man sooner or later into prominence. My only complaint about his letter is that he is far too moderate. Personally, I regard the state of our law as regards irregular medical practice as a screaming farce. We harry the qualified with minute and, in some cases, ridiculous codes, while we permit the unqualified to amass fortunes at the cost of the health and the lives of the community. In other words, the law protects the subject against the heterodox qualified medical practitioner, whilst it refuses to protect him against grossly ignorant persons who fleece the public with assumptions of medical and surgical knowledge.

Let us as a first step rouse the profession to the necessity of reform of the General Medical Council, so as to make it really representative of the medical profession, and not, as it now is, practically in possession of a number of ancient bodies with conflicting individual interests, but never a thought and never a care for the practitioners whose money supports the Council.

I am, Sir, yours truly,

A RETIRED HARLEY STREET PRACTITIONER.

MR. CHIOZZA MONEY AND THE "DANCING" SURGEON.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—I enclose herewith an extract from an article written by Mr. Chiozza Money, M.P., for the *Daily News*, and also my letter dealing with the paragraph. The *Daily News* has inserted my letter, but only in part. Hence this communication dealing with the matter, as owing to the mutilation of my letter it has not been adequately inserted in the columns of your contemporary.

I am, Sir, yours truly,

T. HALLETT FRY.

2, Cloisters, Temple, E.C., June 6th, 1906.

(Copy of letter sent to the Editor, *Daily News*.)

"SIR,—I have read Mr. Chiozza Money's article in your issue of 31st ult., and, despite the fact that he is an authority upon the distinction between earned and unearned incomes, I fail entirely to agree with him when he states 'the recipients [of big fees] certainly do not earn them.' He instances the cases of fashionable surgeons, fashionable barristers, and hot-footed journalists. With the latter I leave Mr. Money himself to deal, as he knows more of the utility to the

community of journalists than I do. However, when we consider the question of the fashionable doctors, the story is entirely different, as it is notorious that no doctor draws huge fees whose labours are not of great benefit to his patients. It is unnecessary to insist that no professional man can get to the top of his profession and draw his "hundreds of pounds" without the possession of very considerable skill, and this skill which is paid for in so many pounds of gold is cheaply bought at the price of life, limb, or health. The case of the fashionable barrister is very similar, and the very instance that Mr. Money gives, viz., the drawing of 'hundreds of pounds in connection with a society libel case,' shows that he has not appreciated at all the value of the services of the members of the profession of the Bar to the public. Is it not necessary to exterminate that objectionable class of calumniators who endeavour to spread ruin often in order to obtain some paltry benefit for themselves, or to self-redress their so-called wrongs in a manner which the law of the land does not permit? Perhaps I may be permitted to maintain that earned incomes include earned incomes of every species, and I should like to add that if such fine distinctions as those of Mr. Money are to be introduced, then it is absurd for any legislative body to endeavour to distinguish between earned and unearned incomes. As has so often been maintained, one strong dividing line is all that is necessary and is all that is possible, and such differentiation as Mr. Money now proposes must evidently defeat his own object of systematic graduation and differentiation between incomes earned and unearned.

"In conclusion I should like to call your attention to the paragraph, which read as follows:—'Persons so employed may be clever men, but their lives are useless to their fellows, and the fees they draw are a huge tax upon the useful labour of others,' and can only add that I consider this sentence to be wholly objectionable.

(Signed) T. HALLETT FRY.

2, Cloisters, Temple, E.C."

Extract from Mr. Money's Article.—"We ought not to conclude hastily that all incomes other than those from property are earned. Professional incomes are often derived from services which are of no value to the community. The existence of a large leisured class, possessing enormous wealth, creates an army of attendants who draw big fees, but who most certainly do not earn them. Take the case of a fashionable barrister, who draws hundreds of pounds in connection with a society libel case, or that of a fashionable surgeon, who wastes his time dancing attendance upon well-to-do vermiform appendices, or that of a journalist hot-foot after a scandal. Persons so employed may be clever men, but their lives are useless to their fellows, and the fees they draw are a huge tax upon the useful labour of others."

[In view of the gratuitous offensiveness of Mr. Chiozza Money's original observations, and the fact that neither apology nor withdrawal has followed, we print the above communication in full.—ED. M.P. & C.]

DIRECT REPRESENTATION ON THE GENERAL MEDICAL COUNCIL.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you permit me to reply to several correspondents who wish to know my views on three points, which, being of general interest, may claim the wide publicity of your columns.

1. As to whether I have any suggestions concerning the education of the medical student before registration: My answer is that as the education of all classes in the country has advanced so rapidly during recent years and no proportionate demands have been made on students before registering, I am of opinion that we must demand that at the very least they shall possess a degree in arts or science. I give this option for the present in order that those who will eventually become members of the profession shall not have been trained in a too fixed and cast iron groove, and so that

both arts and science men may be attracted to its ranks. There are openings for both and it would serve to enrich the personnel of its membership and would help to stimulate a friendly rivalry between these two cultured classes. We should have the pure scientist who has taken the science degree, and he, of course, would be the man to go in more fully for his own department. On the other hand, the arts graduate would not be debarred, of course, from developing the scientific element, but would be more equipped to maintain the more general erudite element of the profession. By this means we should not only get a better class of men throughout the profession, but it would be a very effectual means of eliminating undesirable from its ranks. Those who have no real taste for learning and culture for its own sake would have to seek occupation elsewhere. The teachers at the schools of medicine would have better material to deal with and we might expect a more elevated tone throughout. Another advantage would be that there would be fewer students registered each year, but this would be no great drawback. Enough would join for many years to come until the supply was more on a par with the demand than is the case at present or has been for many years. Rather than adopting the one portal system just now I would endeavour by these means to improve the present one.

2. That in lieu of the benefits which students derived in former days from the apprenticeship system with respect to etiquette, medical students in each of their last two sessions should be compelled to attend at least three lectures on medical ethics.

3. As a nominated candidate for election to the General Medical Council, an expression of opinion has been asked for as to canvassing for public vaccination cases on the part of either medical officers or other Poor-law officers on their behalf. I hold strongly that it should be regarded by the Council as "infamous conduct in a professional respect," and would advocate as stringent punishment as upon those in humbler spheres of the profession.

Since writing the above I have been pleased to see that the University of Wales insists on either a degree in Arts or Science from medical students.

I am, Sir, yours truly,

G. H. BROADBENT.

8, Ardwick Green, Manchester, June 9th, 1906.

THE PRODUCTION OF ANIMAL EXTRACTS.

To the *Editor of THE MEDICAL PRESS AND CIRCULAR.*

SIR.—In view of the great interest being taken at the present time in regard to animal products, and the natural anxiety in the public mind, we wish to state with all the emphasis at our command that it is quite impossible for any of the medicinal products issuing from our laboratory to be contaminated with pathogenic organisms. The precautions taken in the way of inspection of the glands, &c., before they are made use of, the aseptic methods of preparation, and the bacteriological and microscopical, as well as the physiological and chemical tests employed, are such as to make it an absolute impossibility for any disease-bearing germs to be found in any of the active principles or extractives from animal sources made by us. We beg further to say that all our animal preparations are made in our own laboratories under the immediate supervision of those chemists and biologists to whose unremitting watchfulness and care has to be attributed the reputation which our firm enjoy throughout the civilised world, as regards the purity and quality of its medicinal products generally.

We are, Sir, yours truly,

London, June 9th, 1906. PARKE, DAVIS AND Co.

Navy Medical Service.

THE following surgeons have been officially gazetted for promotion to the rank of staff surgeon:—H. C. Whiteside, R. L. Dickinson, H. W. B. Shewell, M.B., M.A., J. Martin, C. B. Fairbank, H. J. Chater, R. St. G. S. Bond, M.B., F.R.C.S., F. C. B. Gitting, M.B., R. M. Richards and A. G. Eastment.

REVIEWS OF BOOKS.

ORTHOPÆDIC SURGERY. (a)

ONE of the most striking and valuable features of this treatise on orthopædic surgery is the number and excellence of the illustrations it contains. There are 592 engravings, most of which are reproductions from photographs of patients showing deformities, and the results obtained by treatment. A large number demonstrate treatment by apparatus and manipulation. Other figures again are intended to portray the attitudes assumed in different pathological conditions. For instance, a series of eight photographs showing the method of getting up from the ground in a patient affected by pseudo-hypertrophic muscular paralysis. Illustrations of this last nature are found throughout the book. They forcibly demonstrate the characteristic attitudes in various diseases, and efficiently take the place of a long verbal description in the text. There are also several good skiagrams.

The treatise is divided into chapters dealing briefly with the etiology and pathology of the subject under discussion, and more fully with the examination, estimation and treatment of the deformities usually considered as belonging to this branch of surgery.

The first five chapters are devoted to tuberculous disease of the spine, hip, knee, ankle and other joints. The chapters on Pott's caries and hip disease are most comprehensive. In the edition before us particular attention has been paid to those subjects in the study of which the greatest recent advances have been made. The most important changes from the second edition, published in 1899, will be found in the chapters treating of congenital dislocation of the hip, scoliosis, traumatic and non-traumatic coxa vara, and non-tubercular diseases of joints. The remaining chapters are taken up with the surgical aspect of rickets, paralysis, talipes, torticollis, and other deformities of the trunk and limbs. Chapter xxi. on "Practical Details of Apparatus" has been added in this edition, and gives the description and drawing of the splints, boots, braces, &c., usually employed in orthopædic work. The information contained in this section of the work will be found useful to the general practitioner, when ordering mechanical appliances in the process of treatment of congenital and acquired deformities.

In conclusion, this Treatise on Orthopædic Surgery is nicely got up, is written in an interesting and lucid style, and possesses the qualities which are likely to ensure its popularity with the profession.

THE PATHOLOGY OF INFLAMMATION. (b)

THIS is a remarkable work for one who has, we imagine, reached or perhaps passed the allotted span of human existence. It is a fine example of fertility of thought, industry, and enthusiasm rarely seen in physicians who have attained unto the venerable position of "consulting" medical advisers to their hospitals. In 1892, Dr. W. H. Ransom, at the Nottingham meeting of the British Medical Association, gave an address before the Section of Medicine on "Some Diseases of Plants Compared with those of Man." The present volume is in great measure an amplification and extension of this address. The author, educated in the forties of last century, was brought up in a school of pathology which viewed inflammation not as a part of general pathology, but as a group of phenomena, some of them objective only, and chiefly exhibited in man. Under the influence of the teaching of the evolutionist and the demonstrations of the experimentalist, the outlook has been widened, and

Lovett, M.D., Surgeon to the Infant's Hospital, and to the Peabody Home for Crippled Children; Assistant in Orthopædic Surgery, Harvard Medical School. Third Edition. London: Baillière, Tindall and Co. 1905. Royal 8vo. Pp. vi, and 670. Price 21s. net.

(b) "The Inflammation Idea in General Pathology." By W. H. Ransom, M.D., F.R.S., F.R.C.P., Consulting Physician to the General Hospital, Nottingham. Pp. vi., 354. London: Williams and Norgate, 1905.

through the self-imposed task of one to whom has been granted the advantages of an exceptionally long retrospect, this fuller view and deeper conception are in these pages faithfully and fully portrayed. Dr. Ransom here shows that the zoo-pathologists and thalo-pathologists must combine experiences, if clear biological ground is to be secured and true insight fully attained as to the nature of pathological processes. In unfolding views relating to the inflammatory idea, the author dwells at length on the result of the study of gall-growths and of cecidia, and in his efforts to present his thesis, he brings forward much of speculative interest and no little of pathological value. The work, however, is mainly critical and contentious, and conclusions are presented in a philosophic form, which at times is almost pedantic. Some of the sentences are of inordinate length, one extending for more than twenty-one lines. There is nothing like a complete reference to modern experiments and recent observations bearing on the subject, although the work of Bashford and Murray and some few other investigators receive almost undue consideration. We could have wished that the venerable author had seen fit to expound his views by reference to what must have been a peculiarly rich and extensive clinical experience. The work as it stands is mainly of academic interest, and we fear will do little to influence present-day opinions or modify current teaching in regard to the nature and mechanism of the reaction of living tissues, vegetable or animal, to the various forms of irritants. The work, however, is an achievement of which the author may well be proud, and we tender him our respectful congratulations, and trust he will be given strength to accomplish the publication of the second part, which he indicates is his full purpose. There is a good index, and the work is well printed, but we regret to say there are no illustrations.

THE NATIONAL DISPENSATORY. (a)

THE title of this great volume gives a good idea of the ground covered by its authors and editors, which include the best-known writers in America on therapeutics, chemistry, botany, and pharmacy. The book is designed to succeed the Dispensatory of Stelle and Maish, which is familiar to all students of materia medica. The sections on the action and use of drugs are edited by Professor Hare, whose writings on therapeutics are so widely read and appreciated, and the information is enhanced by an excellent therapeutical index, in which, under the name of each disease, will be found references to all the medicines employed in its treatment.

The effort to cover a field so immense has swollen the volume to a large size; it consists of 1860 pages, many of which are beautifully illustrated, and as it weighs nine pounds we cannot but regret that it was not bound in two volumes. Ponderous volumes are very inconvenient to handle, and deter the reader, although the cover may bear the respected name of Professor Amory Hare.

DISEASES OF THE RECTUM. (b)

THE object of this small work the author tells us in the preface "is to place before the student and practitioner a brief account of the symptoms, diagnosis, and treatment of the more ordinary diseases which affect the termination of the alimentary canal. It is not intended to contain a complete account of all the morbid changes which occur in this region. Reference to such conditions as congenital malformation, non-

malignant ulceration of the rectum, fibrous stricture of the rectum, and benign tumours has been omitted, partly because I am hopeful that I may have the opportunity of making good these deficiencies at some future time."

The book is up to date, easy to read, and we agree with most of the treatment advocated. We hope the author will soon render the book more complete, for in its present form it is unlikely to take the place of any of the existing books dealing with this region.

We would suggest that the introduction be omitted when the book appears again. For the following is surely unnecessary in a book intended, as the author states, for the student and practitioner:—

"In the history of our species, the ano-rectal region has always been regarded as a contemptible and degraded portion of the anatomy. One cannot be surprised that such should be the case, for it would be unnatural to our instincts to assign any but the meanest place to a member whose functions, however, necessary, are of such an objectionable nature. Personally, the author is unwilling to assent to this popular condemnation. He would submit that, instead of meriting the abuse and neglect to which it is subject, the organ deserves far more consideration and care than is usually bestowed upon it. For the preservation of our health it cannot be denied that the functions of the rectum are fully equal to those of the most honourable and important of our members. Who will deny the fact that these same functions are the most wilfully neglected, and therefore the most frequently disordered, of any of our physiological processes? Unfortunately for himself, mankind has his rectum partially under his own control, it was built to suit his own convenience, and in many cases he has tried to make it his slave rather than his helpmate. Our modern civilisation with its luxuriant and artificialised foods, our lack of exercise and sedentary habits, our false sense of modesty, and above all our unsystematic attempts at a daily routine, are responsible for giving us a monopoly in rectal disorders among all proctodæum-possessing animals," &c.

OBITUARY.

S. FINKELSTEIN, M.D.

MUCH regret has been caused among the Jewish community by the death of Dr. S. Finkelstein, of Manchester, at the age of 41. Before coming to this country, Dr. Finkelstein was assistant physician at one of the principal hospitals in Vienna. He was a member of the British Medical Association, medical officer for the Lancashire and other insurance companies, honorary physician of the Manchester Home for Aged and Needy Jews. He was author of "Extirpation des Schultergürtels nach einer neuen Methode." Being advised to reside in a warmer climate, he gave up his practice in Manchester and went to live in Egypt, death taking place at Alexandria.

WILLIAM GILL, L.F.P.S.GLASG., L.R.C.P.ED.

MR. WILLIAM GILL, the oldest practitioner in Radcliffe, Lancashire, and medical officer for the town, died suddenly at the council offices on the 5th inst. Deceased was educated at Glasgow, where he qualified in 1879. He held various medical appointments and was much respected in the district.

PROFESSOR VON BERGMANN, who recently visited Constantinople in consultation over the third daughter of the Sultan, decided that surgical treatment was unnecessary. Besides a fee of £75,000 his Majesty conferred upon the Professor the Grand Cordon of Osmanieh, with the star in brilliants, and has created him first honorary professor of the Imperial School of Medicine and of the Hamdieh Hospital.

THE annual dinner of the Royal College of Veterinary Surgeons was held at the Trocadero Restaurant on the 8th inst., Mr. Joseph Abson, the president, occupying the chair.

(a) "The National Standard Dispensatory, containing Natural History, Chemistry, Pharmacy, Actions and Uses of Medicines, including those recognised in the Pharmacopœias of the United States, Great Britain, and Germany, in Accordance with the Eighth Decennial Revision of the United States Pharmacopœia, 1905." By Hobart Amory Hare, B.Sc., M.D., Jefferson Medical College, Philadelphia; Charles Caspari, Jr., Ph.D.; and Henry H. Rusby, M.D. London: J. and A. Churchill. 1905.

MEDICAL NEWS IN BRIEF.

Royal College of Surgeons, England—Annual Council Election.

THE annual meeting of Fellows will take place on the first Thursday in July next for the election of three Fellows into the Council of the College. The Exhibition of additions to the Museum of the College will be on view on the same day, and a Fellows' Subscription Dinner will be held in the evening. The members of the Council to retire on this occasion as referred to in another column, are Mr. John Langton, of St. Bartholomew's Hospital, Mr. Henry Morris, of Middlesex Hospital, and Mr. Francis Richardson Cross of Bristol. Mr. Langton will not again offer himself for re-election. Both Mr. Morris and Mr. Cross are candidates for re-election. The other candidates who offer themselves for election to the Council are Mr. George Arthur Wright, of Manchester Royal Infirmary, Mr. William Bruce Clarke, of St. Bartholomew's Hospital, and Mr. Charters James Symonds, of Guy's Hospital. A voting paper will be sent to each Fellow, whose address in the United Kingdom is registered at the College, and Fellows will not be required to apply for voting papers.

With reference to the period of office of the present members of Council the following particulars may be of interest:—In 1907 Mr. F. S. Eve (elected as substitute, for the late Mr. T. R. Jessop, in 1904), Mr. H. W. Page and Mr. Mansell Moullin, retire. In 1908 Mr. Harrison Cripps (elected as substitute for Sir Alfred Cooper in 1905), Mr. Ward Cousins and Mr. Pearce Gould retire. In 1909 Mr. Mayo Robson, Mr. Watson Cheyne and Mr. Clement Lucas retire. In 1910 Mr. Howard Marsh, Mr. John Morgan and Mr. H. H. Clutton retire. In 1911 Mr. Henry Butlin, Mr. Clinton Dent, and Mr. G. H. Makins, retire. In 1912 Mr. Anthony Bowlby, Mr. Gilbert Barling and Mr. Edmund Owen retire. In 1913 Mr. Rickman Godlee and Mr. Golding-Bird retire. Mr. John Tweedy, if not re-elected as President in July next, retires next year.

Royal College of Surgeons, Ireland.

NEW president, Vice-president, and Council:—President—Henry R. Swanzy; Vice-president—John Lentaigne. Council—Edward H. Bennett, William Stoker, Sir Charles Cameron, John B. Story, Sir Charles B. Ball, Sir Thomas Myles, Sir Arthur Chance, Richard D. Purefoy, Sir Lambert H. Ormsby, Henry G. Sherlock, R. Bolton McCausland, John S. M'Arde, Robert H. Woods, Thomas Donnelly, William Taylor, Edward H. Taylor, G. Jameson Johnston, R. Charles B. Maunsell, William Ireland Wheeler.

Medical Prosecution.

AT Marylebone, on the 5th inst., Mr. Le Grand N. Denslow, an American gentleman, of 38, Harley Street, and 36, Dorset Square, was summoned for falsely pretending to be, and using the titles of, a doctor and a physician, thereby implying that he was registered under the Medical Acts of 1858 and 1886, and was recognised by law as such. Mr. Harold Morris, barrister, prosecuted for the Medical Defence Union; and Mr. Freke Palmer, solicitor, defended. Mr. Morris said that the defendant held himself out as a person who could cure locomotor ataxia, and he professed to have effected some wonderful cures. In February last, an advertisement appeared in a daily paper stating that a gentleman, after suffering severely from locomotor ataxia for fifteen years had been cured by a new method, and offering to inform sufferers where he obtained relief. A clerk from the office of the solicitors to the prosecution wrote to the advertiser, and thus obtained the address of the defendant. He then saw the defendant, who said he was Dr. Denslow. The clerk explained that he had a friend suffering from locomotor ataxia, and asked if he could cure him. He replied in the affirmative, and said that he was a specialist for that complaint and had performed some wonderful cures. He added that he was an American

doctor, and the English doctors were too slow in their methods and too old-fashioned. They tried at first to stop him, but without success, and then, in order that he might be in the midst of them, he took rooms in Harley Street. He said that his charge was 500 guineas to those who could afford it, but he should soon be charging 1,000 guineas, for, he added, the cure cost him 150 guineas a week. In the end, however, he agreed to charge a fee of 100 guineas, and to accept 50 guineas down and the balance by arrangement. Mr. Freke Palmer denied that the defendant had falsely pretended to be a doctor in London. He held numerous qualifications, including the M.D. of New York, and up to 1902 he had a large practice in that city and at Minnesota, since which time he had been largely engaged in the investigation of the terrible disease of locomotor ataxia. He entirely disapproved of the advertisement put into the paper by a grateful patient, and, as to his using the title of doctor, he thought he could do so, so long as he did not hold himself out as a London doctor. He was fined £30, with £10 10s. costs.

The Coleman Case—Meeting of the Medical Professions.

A VERY largely attended meeting of the medical profession in Dublin was held at the Royal College of Physicians on Wednesday last, the President (Sir William Smyly) in the chair. The following resolutions were proposed and carried unanimously:—

Proposed by the President of the Royal College of Surgeons (Sir Arthur Chance), seconded by Sir Arthur Macan—"That we, the professional brethren of Dr. James Byrne Coleman, hereby congratulate him on the successful manner in which he has recently refuted the unfounded charges brought against him, and express our sympathy with him in the trouble through which he has passed without blemish on his character or honour."

Proposed by Sir Francis Cruise, seconded by Dr. James Little—"That a copy of the foregoing resolution be sent to every member of the profession in Ireland for their approval."

Proposed by Sir Thornley Stoker, seconded by Sir William Thomson—"That a copy of the first resolution with the names of those approving of it, be publicly presented to Dr. Coleman."

Proposed by the President of the R.C.S. (Sir Arthur Chance) seconded by Mr. John Lentaigne, and carried unanimously—"That a committee consisting of the Presidents and past Presidents of both Royal Colleges be constituted for the purpose of carrying out the foregoing resolutions."

The Royal Medical Benevolent Fund of Ireland.

THE annual meeting of the supporters of this fund was held on Tuesday last in the Royal College of Surgeons. Mr. Henry Swanzy, vice-president of the College, occupied the chair.—Sir John W. Moore read the report of the Central Committee, from which it appeared that nine applications for grants from the relief fund were considered in anticipation of the regular annual distribution, three of these were from new applicants; one was postponed to the annual distribution, and one was refused being ineligible. The other seven cases were all pressing and grants amounting to £95 were made. The total amount of the grants recommended since last distribution is £1,085. The total number of applicants considered during the year was 81. Of these 72 were from the widows of medical men, 5 from, or on behalf of their orphans, and 4 from medical men themselves. Five cases were found on investigation to be ineligible. Only two hospitals have this year forwarded a list of subscriptions from the students attending them, viz, the Royal City of Dublin Hospital and the Meath Hospital. Deputy Surgeon-General Joynt read the treasurer's report, which stated that during the financial year 1905-

1906 '85 grants were awarded by the Central Committee amounting to £8,522 10s. The amount paid through the Central Treasurer was £196 6s. as compared with £216 9s. 6d. the preceding year. Subscriptions received from the branch treasurers amounted to £323 4s. 8d., as compared with £380 14s. 7d. in the preceding year. Since the accounts were closed on April 30th, £50 19s. from Central Branch, and £62 os. 6d. from County Branches have been received.—Sir Thornley Stoker moved the adoption of the report and Sir Lambert Ormsby seconded.—Dr. Kidd (Enniskillen) moved and Dr. W. Taylor seconded the adoption of a resolution thanking the Committee and officers of the parent Society, as well as those of the provincial branches, for their hearty zeal in the Society's beneficent work, and their student brethren, who had contributed tangible proof of their generous sympathy in the cause. Mr. M'Arde (President Irish Medical Association) moved the appointment of the Central Committee and officers, and the hon. secretaries and treasurers of branches for the ensuing year. From what he knew of the Association he felt justified in commending it to the profession.—Dr. Denham seconded the resolution, which was adopted. This concluded the business of the meeting.

West London Medico-Chirurgical Society.

A LARGE gathering of the members of this Society, together with a considerable number of their friends, assembled at the Kensington Town Hall under the presidency of L. A. Bidwell, Esq., F.R.C.S., to listen to the Cavendish Lecture delivered by Sir William Macewen, F.R.S., F.R.C.S., LL.D., on "Some Points on the Surgery of the Lung." Though lasting longer than the specified time, the lecture held the attention of the audience to the very end. Amongst other points, it touched upon the hilum pulmonis being a dangerous place for the surgeon in operations on the lung; on the importance of placing the patient on the affected side in opening the pleura; on the differentiation of pneumothorax and emphysema; on shock being specially caused in operations on the lung by the effect produced on the heart; on the fact that surgery may bring about not only alleviation, but also actual cure in tuberculous destruction of the lung. In support of this last a very interesting case was given.

The President having returned thanks to Sir William Macewen, a move was made to the large hall to inspect the various medical and surgical exhibits which occupied its entire area, some even overflowing on to the stage and into the ante-room, there being no less than forty-five exhibitors. The pleasant smoking conversation was further enlivened by the music of the London Concert Orchestra.

St. Thomas's Hospital.—House Appointments.

THE following gentlemen have been selected as House Officers:—*Casualty Officers*.—(Senior) F. R. E. Wright, M.B.Lond., M.R.C.S., L.R.C.P., D.P.H.; (Junior) L. E. C. Norbury, M.B., B.S., M.R.C.S., L.R.C.P. *Resident House Physicians*.—F. M. Bulley, M.R.C.S., L.R.C.P., M.A.Cantab. (extension); R. C. Jewesbury, M.A., M.B., B.Ch.Oxon., M.R.C.S., L.R.C.P. (extension); M. A. Cassidy, M.A., M.B., B.C.Cantab., M.R.C.S., L.R.C.P.; H. S. Sington, M.R.C.S., L.R.C.P. *House Physicians to Out-Patients*.—H. C. Squires, M.A., M.B., B.Ch.Oxon., M.R.C.S., L.R.C.P.; A. N. Dickson, M.R.C.S., L.R.C.P.; N. R. Cunningham, M.R.C.S., L.R.C.P.; W. O. Sankey, M.R.C.S., L.R.C.P. *Resident House Surgeons*.—H. T. Gray, B.A., B.C., Cantab., M.R.C.S., L.R.C.P. (extension); A. W. Hooker, M.B., B.S.Lond., M.R.C.S., L.R.C.P. (extension); J. H. Drew, M.B., B.S.Lond., M.R.C.S., L.R.C.P. (extension); H. Falk, B.A., M.B., B.C.Cantab., M.R.C.S., L.R.C.P. (extension). *House Surgeons to Out-Patients*.—R. J. H. Cox, M.R.C.S., L.R.C.P. (extension); F. S. Hewett, B.A.Cantab., M.R.C.S., L.R.C.P. (extension); A. B. Howitt, B.A.Cantab., M.R.C.S., L.R.C.P. (extension); W. G. Howarth,

M.A., M.B., B.C.Cantab., M.R.C.S., L.R.C.P. (extension). *Obstetric House Physicians*.—(Senior) S. R. Gibbs, M.R.C.S., L.R.C.P.; (Junior) E. L. Atkinson, M.R.C.S., L.R.C.P. *Ophthalmic House Surgeons*.—(Senior) C. R. B. Eyre, M.R.C.S., L.R.C.P.; (Junior) H. E. Gotelee, M.R.C.S., L.R.C.P. *Throat*.—S. G. MacDonald, B.A.Cantab., M.R.C.S., L.R.C.P. (extension); H. B. Whitehouse, M.R.C.S., L.R.C.P. (extension). *Skin*.—J. Wallace, B.A.Oxon., M.R.C.S., L.R.C.P.; G. L. Webb, B.A., B.C.Cantab., M.R.C.S., L.R.C.P. *Ear*.—A. L. Loughborough, M.R.C.S., L.R.C.P. (extension); G. D. Alexander, B.A.Cantab., M.R.C.S., L.R.C.P. *Children's Surgical*.—C. M. Page, M.R.C.S., L.R.C.P. (extension); S. G. MacDonald, B.A.Cantab., M.R.C.S., L.R.C.P. (extension).

St. Bartholomew's Hospital and College.

DR. W. H. HURTLLEY, D.Sc.Lond., has been appointed to the lectureship on chemistry, and will begin in September next. The department of physics has recently been transferred to larger rooms, and the new laboratory has been thoroughly equipped at a cost of £450. The examination for the Shuter Scholarship, value £50, in anatomy and physiology will be held on July 2 and 3. It is open to graduates in arts of the University of Cambridge.

PASS LIST.

London University.

THE following candidates have passed the M.B., B.S. Examination:—

Honours.—George Cockcroft (*a, d, University Medal*), Guy's Hosp.; Archibald Thos. William Forrester (*c*), St. Bart's Hosp.; Paul Leon Giuseppe (*c, e*), St. Bart's Hosp.; Montague Leonard Hine (*a*), Middlesex Hosp.; Thomas Bramley Layton (*d*), Guy's Hosp.; George Percival Mills (*d*), Univ. of Birmingham; Charles Max Page (*b, d, e*), St. Thomas's Hosp.; John Heatly Spencer (*e*), Charing Cross Hosp.; Violet Ackroyd Turkhud (*b*), Lond. (R.F.H.) Sch. of Med. for Women; H. Francois Vandermin (*a*), Guy's Hosp.; Rawdon Augustus Veale (*a*), Univ. of Leeds; John Alexander Watt (*b, c*), Univ. College; and Arthur Stanley Woodwork (*a, d*), St. Bart's Hosp. (*a*) Distinguished in Medicine; (*b*) Distinguished in Pathology. (*c*) Distinguished in Forensic Medicine and Hygiene. (*d*) Distinguished in Surgery. (*e*) Distinguished in Midwifery and Diseases of Women.

M.B., B.S. (Pass) Examination.—Arnold Alcock, Frank Alcock, Harry R. Allingham, Arthur Beeley, Fitchard J. Bentley, James F. Blackett, Margaret L. A. Boileau, Alexander C. Bryson, Wilfrid E. Burrows, B.Sc., Thomas C. Clare, Geo. P. C. Claridge, Colin Clarke, Leonard Colebrook, Josephine Coupland, Reginald J. H. Cox, Edwin T. H. Davies, George De la Cour, K. R. Drinkwater, B.Sc., James E. Dunbar, Edward V. Dunkley, Hugh R. Evans, Cavendish Fletcher, Peter G. Foulkes, Thomas M. Hardy, Wm. C. F. Harland, Pantland Hick, Frederick W. Higgs, Bernard Higham, Edith B. Hollway, Richard Holtby, Walter L. Holyoak, Annie W. Hyatt, Percy C. P. Ingram, George F. Jones, Andrew M. Jukes, Cecil L. Lakin, George B. McKean, James E. Martin, Robert V. G. Monckton, Helen I. Moss, Alfred H. Parkinson, B.Sc., Theodore C. Pocock, Percy J. Probyn, Hamilton E. Quick, B.Sc., Max. B. Reichwald, Philip M. Roberts, Lillian T. Rowland, Sophia Seekings, Nora F. Smith, Charles A. Stidston, B. Tchaykovsky, B.Sc., Thomas Turner, Howard F. Warner, John B. V. Watts, Arthur G. Wells, Harold B. Whitehouse, and Lillian E. Wilson.

B.S. Examination (for students who graduated in medicine in or before May, 1904) Honours.—John G. French, St. Mary's Hosp.; Reginald A. Greeves, Guy's Hosp.; Harold E. Ridewood, M.D. (University Medal), London Hosp.

B.S. (Pass) Examination.—John James, King's Coll.; Chas. E. W. Lyth, Univ. of Sheffield; James A. Milne, London Hosp.; Charles M. Roberts, St. Thomas' Hosp.; and Gerald W. Russell, Guy's Hosp.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS. ENGLISH AND FOREIGN.

Specially compiled for THE MEDICAL PRESS AND CIRCULAR,
THE RECENT LITERATURE OF PHYSIOLOGY AND PATHOLOGY.

Lymphocytosis in Whooping-Cough.—Churchill (*Journ. of the Amer. Med. Assoc.*, May 19th, 1906) describes the condition of the blood in whooping-cough, basing his results on 86 cases of his own, and 64 reported by others. He finds that a general leucocytosis is present in all cases of whooping-cough, and that a lymphocytosis is present in about 85 per cent. of the cases. This fact he believes to be of considerable diagnostic value, since in none of the diseases likely to be confused with whooping-cough—bronchitis, pharyngitis, laryngitis—is there a lymphocytosis. It is well to emphasise the author's caution to pay heed to the age of the patient in making the examination, since in young children the proportion of lymphocytes to other leucocytes is much higher than it becomes later in life. Thus, in an infant of one year the lymphocytes constitute about 50 per cent. of the total white corpuscles, but from that time forward their relative number gradually diminishes. R.

Agglutination by the Serum in Tuberculous Pleurisy.—Courmont (*Journ. of the Amer. Med. Assoc.*, May 19th, 1906) describes the relation existing between the agglutinative power of the serous effusion in tuberculous pleurisy, and the course of the illness. By a study of 115 cases of the disease he has found that of 67 cases where the effused fluid had a positive agglutinating action, 50 recovered, while of 48 cases where there was no agglutinating action, 35 died or suffered from serious exacerbations. It would follow from these figures that there is a mortality of about 25 per cent. in cases with a positive action, and a mortality about three times as great in cases with a negative action. Moreover, Courmont found reason to believe that the degree of the agglutinating action had a direct bearing on the gravity of the attack. Of 34 cases where there was a feeble sero-reaction, 65 per cent. terminated in recovery, and 35 per cent. fatally. These observations have an important bearing on prognosis. Where the agglutinating action is high, the prognosis is good; where low or absent, it is bad. Moreover, during the course of the illness the action changes. In cases progressing favourably, the power of agglutination continuously improves, while in those where death is imminent the power gradually diminishes, if, indeed, it has been present at any time. R.

The Organism of Syphilis.—Maclennan (*Brit. Med. Journ.*, May 12th, 1906) expands his communication published in that journal of February 3rd, of the present year, and noticed in our Summary of February 21st. In that he suggested a developmental relation between the *spirochæta pallida* and the *cytorrhycles luis* of Siegel, and in the present paper he gives further details in support of this view. In the first place he notices, what many observers have found, that *spirochæta pallida* is invariably found, even in undoubtedly syphilitic lesions, and that apes have been infected with material from which *spirochæta pallida* was apparently absent. Moreover, there are many organisms or bodies observed present with greater frequency than *spirochæta pallida*. In a film populated by every conceivable organism it is hardly logical to take one of the scarcest, though most striking organisms present, and declare it specific. Maclennan, therefore, sets himself to describe in detail the various forms observed by him in smears from syphilitic lesions, and he gives diagrams which seem to show that some at least are stages in the development of the *spirochæta pallida*. The most prevalent form is not unlike the *cytorrhycles luis*, though more closely resembling the Leishman-Donovan body. Such forms seem to have the power

of developing tails, or, at any rate, tailed bodies, very similar to them are found. On the other hand, many *spirochæta* were seen, attached either at the end or at the middle, to spherical or ring-like bodies. Between these two classes, Maclennan thinks he has seen intermediate forms. The main conclusion of the paper is that *spirochæta pallida* is only one stage in the history of a protozoon, of which *cytorrhycles luis* is probably another. Whether this be so or not, Maclennan has certainly added to our knowledge of the life-history of *spirochæta pallida*. R.

Protozoa in Syphilis.—De Korte (*Practitioner*, June, 1906) describes certain bodies he has observed present in syphilitic chancres, and condylomata, and in the blood during the secondary stage of syphilis. He thinks it a strong point against the *spirochæta pallida* that it is not commonly present in the blood during the infective period of syphilis. In searching for it, however, he has constantly met with the bodies he describes. The most common of these is a small, very dark, circular body, measuring from 2m. upwards, and closely resembling an air bubble. As figured, the body is indistinguishable from a deeply-stained lymphocyte. At a later stage, this body is described as extruding two polar bodies, and, later still, it becomes cystic, consisting of a hyaline ectocyst with a very dark endocyst. The effect of mercury on the blood is to cause rupture of the cyst, and, finally, complete disappearance of all the bodies. It will be noticed that the body observed most commonly by De Korté has some resemblance to one of the bodies described by Maclennan, though De Korté does not suggest any relation with the *spirochæta*. R.

The Influenza Bacillus.—Jorhmann (*Deutsch. Archiv. f. Klin. Med.*, Bd. 84, Heft. 5 and 6) found influenza bacilli relatively frequently in the broncho-pneumonic patches of measles and diphtheria cases, and less often in scarlatina without any difference existing in the clinical phenomena. He also found bacilli with characteristics similar to those of Pfeiffer's organism in the sputum of these cases, and also along with other bacteria in twelve cases of pulmonary phthisis. On the other hand, he only found them in twelve out of thirty-six cases which were diagnosed clinically as influenza. Jorhmann accordingly denies the etiological importance of so-called influenza bacilli in cases of true influenza, and thinks that other organisms must play a part in influenza epidemics. He considers, moreover, that the bacilli cannot be regarded as the causative agent in the catarrhal processes of children, but believes that they should rather be looked upon as parasitic bacilli. M.

Dysentery in England.—Saundby (*Brit. Med. Journ.*, June 9, 1906) publishes two cases of dysentery occurring in England. He very justly criticises the illogical distinction made by Hale White and others following him, between dysentery and what they term "ulcerative colitis." As Saundby points out, the disease known as "ulcerative colitis" has the morbid anatomy, symptoms, and treatment, of dysentery, but yet has been classed as distinct. In recent years bacteriological investigation has bridged across the supposed gap, and it is only in England that any attempt at a distinction still persists. In the later of Saundby's two cases, Hewetson succeeded in detecting and isolating the bacillus of Shiga, thereby establishing the identity of the disease with one of the most common forms of tropical dysentery. Saundby is perhaps right in stating that this is the first discovery of the Shiga bacillus in the dysentery of this country, but McWeeney

of Dublin isolated last year a very similar, if not identical, organism from a case of asylum dysentery (MEDICAL PRESS AND CIRCULAR, April 26, 1905).

R.

Pathology of Yellow Fever.—Marchaux and Simond (*Annales de l'Institut Pasteur*, March 25th, 1906) publish their fourth and last memoir detailing the results of their researches into yellow fever. The present contribution gives an account of the pathological anatomy of the disease, together with a general summary.

As regards the anatomy, the authors find no gross lesion other than the well-known points of the colour of the body, the colour and consistency of the liver, and the punctiform hæmorrhages of the brain and digestive tract. In regard to minute changes, they entirely bear out the statement of Sodre and Couto that the disease is a generalised steatosis. While all the organs undergo more or less fatty degeneration, this change is most marked in glandular epithelium. The glands of the skin, and of the intestine, however, as well as the intestinal epithelium, always escape. The changes in the liver are progressive, with, in protracted cases, distinct signs of regeneration. The anatomical conditions are illustrated by beautiful plates.

In summing up their general results, the authors state that there is no other means of infection than by the bite of the *Stegomyia fasciata*. The bites of all other mosquitoes, and the handling of blood, excreta, fomites, and the organs of dead subjects, are innocuous. Moreover, the *stegomyia* only bites at night, and it cannot become infected from any other source than the actual body of a patient suffering from yellow fever in the first three days of the disease. For an infected *stegomyia* to become infective, a period of twelve days must elapse. In certain conditions the female insect may transmit infection to her offspring, but never beyond the first generation.

As to the virus itself, the authors find that it can be experimentally conveyed by inoculation of the blood of a patient in the first four days of the disease. To have effect, however, the inoculation must be by injection of the blood or serum into the tissues; mere rubbing of the serum into a raw surface has no effect. The microbe is very small, as it traverses, in a diluted serum, the Chamberland B. filter. It is easily destroyed, warming for five minutes at 55° rendering infected serum innocuous. Blood exposed to the air at ordinary temperatures, loses its virulence in forty-eight hours.

The ordinary period of incubation is from four to six days, though in some cases it may be as long as thirteen days. The serum of a convalescent contains protective bodies to such an extent that it has curative properties. One attack confers immunity, usually permanent, but occasionally only temporary, second attacks, however, being benign. No race has any natural immunity to the disease. Although all ages are susceptible, the child rarely suffers severely.

It follows from these highly important observations, that on the side of prophylaxis it is necessary carefully to isolate all cases of yellow fever, not from men, but from mosquitoes. The larvæ of the *stegomyia* must be destroyed wherever practicable, and all inhabitants of infected regions should protect themselves from mosquito-bites, especially at night.

R.

Eosinophilia.—Staubli (*Deutsch. Archiv f. Klin. Med.*, Bd. 85, Heft 1 and 2), after meeting with several cases which presented an increase of eosinophiles up to from 24 to 30 per cent. of all leucocytes present, determined to study the condition experimentally. For this purpose, he fed guinea-pigs with flesh infected by *trichinæ*, and found that eosinophile cells began to increase in number about eight days later, about the time when the parasites began to pass into the general tissues from the intestinal wall. The number gradually rose to from 1500 to 5,000 per cm., and again fell, except in very severe infections. Incidentally, Staubli confirmed the view of Teslar and others that *trichinæ* embryos are developed within the intestinal wall and

are carried into the blood *via* the thoracic duct. He found no alteration in number of eosinophile cells in the bone marrow, nor in the intestinal walls or even within the muscles in the neighbourhood of the encapsulated parasites. The peculiar relation which eosinophile cells present to bacterial affections was also demonstrated. In the peritoneal fluid and in the mesenteric tissue of guinea-pigs, large numbers of these cells are found. Intraperitoneal injections of living or dead bacteria cause them to rapidly disappear, apparently owing to a negative chemotaxis. On the other hand, intravenous injections of bacteria have little effect.

M.

Aspergillus Niger in Pulmonary Affections.—Risel points out (*Deutsch. Archiv. f. Klin. Med.*, Bd. 85, Heft 3 and 4) that while *Aspergillus fumigatus* has long been known to have pathogenic properties, nothing certain has as yet been proved with reference to *Aspergillus Niger*. He then records a case in which the pathogenicity of this mould seems undoubted. It was a case of a tuberculous diabetic patient in the apex of whose lung a large vomica was found, the inner wall of which was covered over with a continuous layer of the *Aspergillus Niger*. The mould had also grown for some distance into the surrounding tissue. Cultures gave typical *Aspergillus Niger*, and experiment showed that injections into the lungs of rabbits produced a pseudo-tuberculous condition.

M.

Activation of Pancreatic Juice by Calcium Salts.—Delezenne refers to the fact (*Compt. Rend. de l'Acad. des Sciences*, T. 141, No. 20) that pancreas when thrown as fresh as possible into sodium fluoride solution and macerated, yields a fluid which is quite inactive, but which can be activated by the addition of intestinal juice. Also intestinal juice prepared in a similar way is inactive, while that from the intestinal glands is active. This observation led Delezenne to the conjecture that it might be calcium salts, which rendered possible the activity of pancreatic and intestinal juices, and this supposition was substantiated by finding that the addition of lime salts readily activated previously inactive pancreatic and intestinal juices. When the juices contained much sodium carbonate or phosphate, much lime had to be added to bring about the desired result. The discovery throws much light on the relation of lime salts to ferment action, and in particular on the action of entero-kinase.

M.

Fœtal Pneumonia.—Bochenski and Gröbel describe a case *Casopsis lekaru ceskych*, 1905, p. 1159) of a woman who got an attack of lobar pneumonia during the last month of pregnancy. Three days after the onset the child was born in a cyanosed condition, and over its lungs small liquid rales were audible, and a dull note was obtained on percussion. The child died eleven hours after birth, and the autopsy showed acute catarrhal bronchitis with confluent hæmorrhagic lobar pneumonia of both lungs. The cause of the inflammation was proved by histological examination and by culture methods to be the pneumococcus of Frankel. Portions of the lungs were in a condition of grey hepatisation, proving that the disease must have originated before birth. The authors isolated the pneumococcus from the mother's blood, and state their belief that it had passed thence *via* the placenta into the fœtal circulation. The reason why the other organs of the child escaped is difficult to assign, unless the lungs be regarded as a *locus resistentiæ minoris* to the attacks of the pneumococcus. No examination of the placenta was made.

M.

NOTE.—A summary will appear each week in the following sequence:—(1) "Recent Medical Literature." (2) "Recent Surgical Literature." (3) "Recent Gynecological and Obstetrical Literature." (4) "The Recent Literature of Physiology and Pathology."

NOTICES TO CORRESPONDENTS, &c.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

REPRINTS.—Reprints of articles appearing in this journal can be had at a reduced rate, providing authors give notice to the Publisher or Printer before the type has been distributed. This should be done when returning proofs.

MODIFIED DRIED MILK FOR INFANT FEEDING.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—I am sorry that I was out of town when the proof of the short article by Dr. Harper and me arrived, so that I could not get it returned in time.

In the last paragraph but one there are a couple of printers' errors which alter materially the meaning of that paragraph. The reading should be: "and in all cases where condensed milks are used. It is advisable to administer, &c." The omission of period and capital you will see completely alters the sense.

Might I trouble you to kindly correct in your next issue.

Very faithfully yours,

D. SOMMERVILLE, M.D.,
Lecturer on Public Health in
King's College, London.

London, June 8th.

A WARNING.

We reprint the following experience of a doctor in Johannesburg from the *Liverpool Daily Courier* in the hope that it may be useful to those who meditate emigrating to South Africa:—

To the Editor of the LIVERPOOL COURIER.

SIR,—I have been here three months, and as things are in a very bad way I am sorry I have left Kimberley. I have come out at a bad time, as the place is almost bankrupt, and the best people are leaving for home almost every day, because of the interference of the home Government with the Chinese. Owing to the uncertainty several of the mines are every week discharging hands, who swell the ranks of the unemployed, a number of whom are walking the streets half starved. There is a bitter feeling against the home Government, and it would take very little more to start a riot or revolution. It is dangerous to be out after dark. Band-bagging and robbery are of daily occurrence, so the sooner you turn out the present Government the better it will be for everybody.—Yours, &c.,
Johannesburg, May, 1906.

A CANARD.

We learn on most trustworthy authority that there is no truth whatever in the report (which has lately been going the round of medical circles) "That the Egyptian Government has summoned one of our leading surgeon-oculists to proceed to Egypt without delay and remove the cataracts from the Nile (so long an eyesore)."—A. D.

SHIP SURGEON.—For the most part gynecologists condemn all attempts at destruction of the foetal life in extra-uterine foetation. Many such methods, as by electrical current, tapping, and injection of various fluids have been devised, but they are uncertain and dangerous. The only scientific plan is the exploratory incision, with removal of foetus if present. Under such circumstances at sea, you would be justified in conducting the operation single handed in the absence of skilled assistance.

THE PROFIT ON PILLS.

The Australian Customs authorities have recently sued an importer of medicines liable to duty. The action arose over an importation of a quack medicine called "Dr. Morse's Indian Root Pills." The importer of these pills gave the value of the consignment as £154 and paid £23 2s. as duty. The selling value, on which the Customs established their right to levy duty, was £2,160 8s. Thus pills at £154 and duty at £23 2s. equals £177 2s., the selling price of which amounts to £2,160 8s.

Meetings of the Societies, Lectures, &c.

WEDNESDAY, JUNE 13th.

DERMATOLOGICAL SOCIETY OF LONDON (11 Chandos Street, Cavendish Square, W.).—5.15 p.m. Meeting.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. L. Cheate; Clinique. (Surgical). 5.15 p.m. Lecture:—Mr. J. Poland: The Use of Mechanical Appliances in Surgical Treatment.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. F. Taylor: Medicine. 3.15 p.m. Mr. M. Robson: Surgery. 4 p.m. Mr. Cargill: Ophthalmology. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

THURSDAY, JUNE 14th.

BRITISH GYNECOLOGICAL SOCIETY (20 Hanover Square, W.).—8 p.m. Specimens will be shown by Dr. Macnaughton-Jones. Paper:—Dr. R. Lyle: A Series of 50 Consecutive Abdominal Sections.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. Hutchinson: Clinique. (Surgical). 5.15 p.m. Lecture:—Mr. M. Fletcher: Certain Points in the Diagnosis and Treatment of Meningitis.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. G. Rankin: Medicine. 3.15 p.m. Sir W. Bennett: Surgery. 4 p.m. Mr. M. Davidson: Radiography. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Ear and Throat.

FRIDAY, JUNE 15th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Clinique. (Ear).

POST-GRADUATE COLLEGE (West London Hospital, Hammer-smith Road, W.).—10 a.m. Medical and Surgical Wards. Practical Anaesthetics. 11 a.m. Minor Operations. 2 p.m. Medical and Surgical Clinics. 2.30 p.m. Operations. 3 p.m. Mr. Bidwell: Intestinal Surgery. 6 p.m. Mr. Paget: Surgical Cases.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. R. Bradford: Medicine. 3.15 p.m. Mr. McGavin: Surgery. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Skin.

SATURDAY, JUNE 16th.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

Vacancies.

Brecknock County and Borough Infirmary.—Resident House Surgeon. Salary £100 per annum, with furnished apartments, board, and attendance, fire, and gas. Applications to W. Powell Price, Secretary, 6, The Bulwark, Breton, South Wales.

Bolton Infirmary and Dispensary.—Junior House Surgeon. Salary £100 per annum, with furnished apartments, board and attendance. Applications to the Hon. Secretary, W. W. Cannon, Esq. 20 Mawdsley Street, Bolton.

West Derby Union.—Assistant Resident Medical Officer. Salary £125 per annum, with board. Applications to Harris P. Cleaver, Union Clerk, Union Offices, Brougham Terrace, Liverpool.

The Liverpool Hospital for Consumption and Diseases of the Chest.—Pathologist and Assistant to the Honorary Medical Staff. Salary £150 per annum. Applications to the Secretary, 77A, Lord Street, Liverpool.

North-Eastern Hospital for Children, Hackney Road, Bethnal Green, E.—Resident Medical Officer. Salary £100 per annum, with board, residence, and washing. Applications to the Secretary.

Barnsley Hall Asylum, Broomgrove, Worcestershire.—Medical Superintendent. Salary £300 per annum, with unfurnished house, fuel, electric light, washing, and garden produce. Applications to Robert J. Oliver, Clerk of the Visiting Committee, Shirehall, Worcester.

Hants County Asylum.—Third Assistant Medical Officer. Salary £150 per annum, with furnished apartments, board, washing and attendance. Applications to the Visiting Committee, Hants County Asylum, Fareham.

London Open Air Sanatorium, Pinewood, Wokingham, Berks.—Assistant Medical Officer. Salary £100 per annum and all found. Applications to the Medical Superintendent.

Sheffield Union Hospital.—Resident Medical Officer. Salary £100 per annum, with apartments, rations, &c. Applications to Albert Edwd. Booker, Clerk to the Guardians, Union Offices, Westbar, Sheffield.

Appointments.

LANDER, CHARLES LLEWELLYN, M.B., B.S., B.Sc.Lond., Assistant Surgeon to the Royal Albert Hospital, Devonport.

MAX, W. PAGE, M.D.Lond., F.R.C.P.Lond., Lecturer on the Physiology of the Nervous System at University College, London.

MCDONALD, J., M.B., M.S.Glasg., Certifying Surgeon under the Factory and Workshop Act for the Barking District of the county of Essex.

MCENTRY, JAMES JOSEPH, L.R.C.P. and S.Edin., L.F.P.S.Glasg., Medical Officer of Health for the Shire of Kerang, Victoria, Australia.

NAYLOR, RUPERT GEORGE, L.R.C.P.Edin., F.R.C.S.Edin., Medical Officer of Health for the Shires of Bulla and Melton, Victoria, Australia.

PORTER, A. E., M.D., D.P.H.Camb., Medical Officer of Health of the Borough and Rural District of Reigate.

SOOTT, ERIC NORMAN, L.R.C.P. and S.Edin., L.F.P.S.Glasg., Medical Officer of Health for Arwata, Korumburra, and Jumbunna Ridings, Victoria, Australia.

Births.

PATERSON.—On June 3rd, at Boaz Island, Bermuda, the wife of Major Ian Paterson, B.A.M.C., of a daughter.

Marriages.

MOWAT—BOWDEN.—On June 8th, at St. Andrew's Church, Nottingham, Harold Mowat, M.B., Ch.B., youngest son of Magnus Mowat, J.P., of Granville Park, Blackheath, to Winifred, second daughter of Frank Bowden, of Elmwood, Nottingham.

RAND—BOWRING.—On June 7th, at St. Mary's Church, Long Ditton, Arthur Harold Rand, youngest son of John Rand, F.R.C.S., of Lovelace Road, Surbiton, to Winifred Florine, elder daughter of Edward J. Bowring, of Westcroft, Long Ditton.

RENTON—WILSON.—On June 7th, Ralph Stuart Renton, M.B., B.I., of Blackhill, co. Durham, to Melene Dare, daughter of Mrs. Wilson, Rose Cottage, Shotley Bridge.

Deaths.

BREWIS.—On June 5th, at "Curriemyre," Willington, co. Durham, Lenna, the dearly-beloved wife of Edward J. Brewis, M.D.

CANN.—On June 5th, at the house of his son-in-law, the Rev. E. E. Peters, Bedworth, Warwickshire, Thomas Martyn Cann, M.R.C.S. of Newhaven, Sussex, aged 66.

HAYWARD.—On June 8th, at Haydock, Lancashire, Thomas Ernest Hayward, M.B.Lond., F.R.C.S.Eng.

OWEN.—On June 7th, at 2, Brandling Park, Newcastle-on-Tyne, within a few hours of birth, Ethel Elizabeth Holland, daughter of Sir Isambard Owen, M.A., M.D., &c., &c.

No. 25

NOTES AND COMMENTS.

**A
Curious
Slander.**

A CASE presenting an unusual form of attack upon a medical man was tried at Kingston-on-Thames last week. It arose out of the energetic action of the

Medical Defence Union in defending the honour of a medical man, Dr. Albert Max Sully, who considered that he had been, or was likely to be, injured by the defendants. In evidence it appeared that a woman, Alice Wray, aged twenty-one, had caused Dr. Sully considerable personal annoyance in 1902, and that Dr. Sully had demanded and received an apology from the woman and her mother withdrawing certain allegations, and that since receiving their letter he had declined to attend them professionally. Last February the younger woman gave birth to a child, and she registered his birth in the name of "Arthur Albert Max Sully." Shortly afterwards the child died, and the elder defendant registered the death in the same name. These actions seemed to Dr. Sully and the Medical Defence Union as an attempt to create the impression in the locality that Dr. Sully was father to the child, especially as the mother gave the name of "Sully, formerly Wray," to the registrar. On the charge of giving false evidence when registering the birth, the Registrar-General brought the two women before the magistrates, and in Court they confessed that the woman was not actually married, but was going to be to a Mr. Sully. No evidence was forthcoming as to the presence of this second Mr. Sully in Claygate, the neighbourhood in question, and Alice Wray confessed she did not know where he was now. Yet it was because this mysterious Mr. Sully was father to the child that she gave him the name complained of! She stated that she did not accuse Dr. Sully of being the father, and of course no suspicion of any kind was attached to that gentleman by the Court.

**Dr.
Sully
Vindicated**

THE Medical Defence Union scored the success which we have now learnt to look for more or less as a matter of course. The view taken by the magistrates was that

the offence was an error of judgment rather than a deliberate crime, and the women were let off with a moderate fine. Dr. Sully has the satisfaction of clearing his name, but we consider the women remarkably lucky in getting off so lightly on the defence put forward. A more impudent and atrocious form of attack upon a member of an

honourable profession it would be hard to imagine. It is a matter of much significance to the medical profession that the Registrar-General has come forward as prosecutor in this case. If he would extend his energy in a more active defence of the legal veracity of certificates of births and deaths, he would confer a vast boon on the community by way of checking the operations of a host of quacks and charlatans.

**The London
Hospital
and Opsonins**

ANY medical practitioner who allows himself to be interviewed by a newspaper reporter with a view to publication rightly incurs the condemnation of his fellows.

It is not easy to say why that general rule should not apply to a medical man simply because he happens to be within the walls of a hospital. In the *Daily News* of June 8th is the account of an interview with "a pathological expert at the London Hospital," who discussed in learned fashion the experiments with opsonins, dating back, as he ingenuously admitted, no longer than the year 1903. Upon the strength of this mature experience, the London Hospital poses before the world as the apostle of a new era in therapeutics, which is announced to an admiring public by the honorary secretary, a layman, through the medium of the Board of Governors. Why should not experiments of a highly technical kind be carefully investigated and results communicated to the medical profession through the usual channels of the medical journals and the medical societies?

**Fleet Street
Science.**

The communication of the "pathological expert" is calculated to rouse the curiosity of the man in the street to fever-

pitch. It seems hardly credible that Fleet Street should favour its readers with the following abstruse scientific information, which we quote without comment: "Besides tubercle, we can apply the opsonic principle to boils, carbuncles, streptococcus, bacillus coli, pneumo-coccus, Malta fever, and many diseases. What is new, however, is that we are now enabled to watch the progress of our experiments and treat our patients according to their condition. This we do by means of the opsonic index. The *modus operandi* is briefly this: We gather the micro-organisms of the disease, which, after culture, we kill by submitting them to a heat of about 62° C. Then, by sub-cutaneous

injection we inoculate and in that way stimulate the patient to produce his own protective bodies; in other words, to increase his powers of resistance against the disease."

LEADING ARTICLE.

INFANT MORTALITY AND PATENT MEDICINES.

ONE of the least understood of sociological problems is that of the national conscience. It may slumber for centuries amid surroundings of an ethically immoral nature, and then wake up when least expected to an overwhelming sense of the necessity of reform. Viewed broadly, its general trend is certainly in the direction of progressive humanity, more especially as regards the inner life and government of communities. Of late years its attention has been riveted upon questions of public health affecting the nation as a whole, such as sewage disposal and the purity of food and water. One of its most remarkable developments, however, has been the increasing study of child-life. It may be claimed, indeed that the complex conditions of heredity and environment concerned in the upbringing of the child in health and in disease have never before been approached in a purely scientific spirit. Statistics point with unerring finger to the fact that hitherto our infant population has been ruthlessly sacrificed by ignorance of various elementary laws. The recent National Conference on Infantile Mortality held in London may be taken as an indication of the modern attitude of awakened interest. The Right Hon. John Burns, M.P., President of the Local Government Board, put the matter in a nutshell when he stated that, roughly speaking, 100,000 infant lives were being sacrificed every year to neglect, carelessness, thoughtlessness and ignorance. In the first year of life there were as many deaths as in all the other years taken together up to the age of eighteen. The average expectation of life in one particular class, engineers, had during the past half-century been raised by the very noteworthy addition of ten or twelve years. At the same time, the average ages of the wives had been extended by a similar period. But, in spite of that remarkable saving of adult life the infantile mortality in that particular class had been practically stationary. A fact of that kind could not fail to make a deep impression upon the mind of so shrewd an observer of social problems as Mr. John Burns. It brings us to the kernel of the matter, inasmuch as it contains the inevitable conclusion that the excessive infantile mortality is preventable just as the adult death-rate was preventable and has been prevented. We may not be able to share with Mr. Burns' roseate view that the result of the Congress over which he presided should be to bring down in the next five or

ten years the infantile mortality by 30 per cent. or more. Within the period mentioned a great deal can unquestionably be accomplished, but many obstacles must be surmounted ere the dreams of the philanthropist are likely to be fulfilled in this particular field. At the very outset we are faced by an imperfect medical knowledge of many of the physiological and pathological problems of child-life, but the subject is happily emerging rapidly into regions of scientific light. Then, again, the question of infantile mortality is inextricably wrapt up in that of the conditions of labour. The extent to which poverty is concerned may be shown by the fact that in the Royal, borough of Kensington the infantile death-rate in the poorer districts is sometimes ten to twenty times higher than in the richer localities of the same suburb. Then, again, the absence of mothers when engaged in work at factories entails disastrous results upon the little ones left at home. Improper feeding accounts for a vast number of deaths. Let us add to Mr. Burns' list the vast army of children sacrificed every year by patent medicines. Any coroner of experience could give a list of soothing syrups, cough drops, teething powders and other proprietary medicines for children which sacrifice life wholesale. These murderous nostrums are sold under the ægis of a Government stamp, and depend for their sale upon newspaper advertisement. So that we have here the grim irony of a Government and a public press that demand the reduction of our excessive infantile mortality on the one hand, while on the other they are doing their best to swell that mortality by encouraging the deadly traffic of the patent medicine man. We commend this view of the situation to Mr. John Burns and to the earnest band of workers who have taken up the great national question of infantile mortality.

British Medical Association—Toronto Meeting.

WE are asked by the Honorary Local Secretary to make the following announcement:—It is hoped that most of the European visitors to Toronto will avail themselves of the opportunity of crossing the Continent to the Pacific Coast, where they will see for themselves the vast extent of the Canadian "Wheat Fields," the magnificence of the scenery in the Rockies and the wonderful possibilities for mining and other enterprises. To enable the local committee to arrange for this trans-continental trip, it is desirable that those contemplating it should send their names to the *Honorary Local Secretaries, Medical Building, Toronto*, at an early date. The cost for the round trip from Toronto is \$67.75. (£13 11s.).

Because of the difficulty of transporting several hundred by a special train, it has been thought desirable, both by the Local Committee and the Local Authorities, that the various members be sent off in groups of from eighteen to twenty-five. That would mean giving them a special sleeping car to themselves; consequently, if the names of certain groups that would prefer to travel together could be sent in, it would be a still greater convenience; or even if groups of ten or twelve could be sent in, the Local Committee will make an endeavour to couple certain groups of British, Canadian and American visitors in the hope of increasing the mutual interest and enjoyment of the trip.

NOTES ON CURRENT TOPICS.

A Side-light on Medical Education.

THE usual misuse is being made of the returns of the examinations for the Medical Department of the Royal Navy, the Royal Army Medical Corps, and the Indian Medical Service. Year after year the General Medical Council solemnly receives these returns and refers them to the Examination Committee, and year after year the medical and lay papers solemnly lecture the corporations and the public on the conclusions they choose to deduce from them. As a matter of fact, in so far as the returns are supposed to cast, as the phrase is, "a side-light on medical education," as given by the various corporations in the three countries, they are quite valueless. Any comparison of the different licensing bodies would depend on two assumptions, neither of which is justified. The first is that candidates from the provinces and from Scotland and Ireland compete at the service examinations on the same terms as London candidates. This they do not, as the examiners are almost altogether members of the London school and any variation from medical London opinion is bound to be regarded as a fault. The second assumption is that the candidates from each school are representative of the standard of that school. This is unlikely to be true, since some schools have "service tradition" and their best men look to one or other of the services for a career, while in others there is no such tradition, and but a few men, who may be good, bad or mediocre, present themselves for competition. When the returns are considered in detail, the numbers are seen to be much too small and uneven to admit of the percentage comparisons which some of our contemporaries diligently compile. Thus, to take one example, 100 per cent. of the candidates from the English Conjoint Board, Edinburgh University and Aberdeen University, are said to have "qualified." This result, however, is based on 39 candidates from the Conjoint Board, 20 from Edinburgh, and 2 from Aberdeen. We fail to see any just conclusion likely to be drawn from these returns, and we fail to see any reason for the sanction they receive from the General Medical Council.

The French Medical Excursions.

SUPPORTERS of the *entente cordiale* among the medical profession, in one way or another, are afforded plenty of opportunities of international intercourse. The interesting series of trips organised within the last year or two by French medical men to various watering places have proved a great success. In issuing their invitation this year it has been found necessary to limit the number of invitations, as it was found almost impossible to provide for a party of 150 visitors suddenly invading a small town or village. In future it is announced that the total number will not exceed 100, and that invitations will be allotted to various counties. Under the new

scheme Great Britain receives a proportion of twenty. In order to secure a place, therefore, it will be necessary to make immediate application. The movement is clearly one of great value to the development of French health resorts, and might be followed with advantage by our own countrymen.

"Are Doctors Greedy?"

UNDER the catchpenny title, "Are Doctors greedy?" a newspaper discussion has been recently carried on in the *Sheffield Daily Telegraph*. Needless to say, the views advanced on either side are not of high intellectual calibre. The original proposition was that of a Mr. J. E. Bradwell, who read a paper on the subject before the Sheffield United Friendly Societies Council. As may be imagined, his remarks were mainly directed to the relations of the medical profession with friendly societies. The grievance arose when medical men declined any longer to regard two shillings per member per annum as adequate payment for their services. The demand for a higher scale evoked from Mr. Bradwell the view "they had expressed their demands in words which would be somewhat in place in the mouth of a highway robber, holding a pistol to the head of a defenceless traveller, but scarcely what should be expected from a body of cultured, refined, and tender-hearted gentlemen." Medical men clearly give solid services in return for a paltry payment, so that the analogy of the highwayman is no happier than the comparison of the defenceless traveller with the friendly societies. The latter evidently think that all the business part of the transaction should appertain to the societies, and that tender-hearted professional gentlemen should not soil their hands by interfering with such transactions.

U. C. H. School and Nursing Home.

UNIVERSITY COLLEGE HOSPITAL may indeed consider itself lucky, for it has found what every charitable institution is always looking for—a fairy godfather, or, in its own case, two fairy godfathers who have come along and cut the financial knot. In the first place the late Sir John Blundell Maple re-built the hospital and brought it up to the requirements of modern hygiene; and secondly, Sir Donald Currie presented it with £100,000 to build a new Medical School and Nurses' Home. The hospital itself has been completed for sometime, and on June 11th the foundation stones of the new School and Home were laid by the donor himself. It is gratifying to know that the whole of the princely donation will not be swallowed up in building expenses, but that according to estimate some £20,000 will be left over after the erection is complete for the purpose of forming the nucleus of an endowment fund. But pleasant as it is to be able to dwell on individual generosity, it cannot be regarded as satisfactory that a community which relieves its sick poor by charitable institutions depends on receiving large sums from a few wealthy persons rather than on subscriptions sent by all people according to their means. In

this matter London is notoriously behind the provincial towns, and its needs are proportionately greater as being the centre of a great district and a vast Empire. Mr. Carnegie, we believe, refuses to give donations in large amounts to hospitals, because he considers that there should be a charge which all should contribute to and be willing to bear without appeals to the specially wealthy.

Food Inspectors' Hypocrisy.

THE public are notoriously prone to be guided by the *dernier cri* and by that alone, so that one need not be surprised that at present they are giving vent by all the usual channels of expression to disgust and horror over the American meat scandals. That newspapers should be filled with inflammatory articles and that questions galore should be asked in Parliament is only to be expected, and we hope that whatever action may be taken as the result of the agitation will ensure a cleanly and healthy supply of good meat coming to us from America; but it savours not a little of hypocrisy that in England, where food inspection is of the flimsiest nature, as a rule, and where few authorities concern themselves to have inspectors who know the pathological appearances of the commonest diseases of animals, the outcry should be so loud and vehement. With few public abattoirs in the country it is impossible, even for the most highly qualified inspectors, to keep any supervision over the meat prepared for the public; and with regulations often conspicuous by their absence the milk-trade is conducted in a scandalous fashion and causes—it may be asserted without fear of contradiction—thousands of cases of disease and death annually. If the British people would examine the beams in their own eyes before plucking so vigorously at those in their neighbours they would cut a more dignified figure, and one that would command more general respect.

The Ameer and Lady Doctors.

MR. RUDYARD KIPLING has familiarised us with the deeds of native rulers that win recognition from the Indian Government. Among these the improvement of sanitation would seem to play an important part. The particular prince, of whom Mr. Kipling sings, calculated that a new sewer should be worth at least a C.S.I., and stopped all his beneficent operations in disgust when he found he was only to receive a C.I.E. What honour, we wonder, is regarded as an equivalent for engaging English women doctors to attend on the ladies of a ruler's harem? It appears that the Ameer of Afghanistan, whose father long had an English doctor for himself, lately came to the conclusion that the ladies who live under his protection should also receive the benefits of Occidental science, and qualified women doctors were appointed to the Court. Unfortunately this step did not commend itself in practice to Nasrullah Khan, his brother, who has been managing the affairs of the kingdom in the Ameer's absence,

and now that the potentate has returned to take up the government in person a conflict of opinion is going on at Court. What the result of it may be, we dare not venture to prognosticate, but Nasrullah is said to be backed by an influential coterie of nobles, whilst the Ameer is "on the side of the angels." Knowing the usual character of Eastern despots, to whom the Ameer appears to be no exception, we can only wish the ladies a happy issue out of their troubles without any of the Oriental amenities that generally accompany a monarch's displeasure.

Hospital Sunday in London.

ON the 17th instant the great annual festival of Hospital Sunday was celebrated in London. In spite of the attraction of rival metropolitan institutions, it is confidently believed that the donations will exceed those of any previous year. The State service at St. Paul's was attended by the Lord Mayor, who was supported by His Majesty's judges, and a number of City officials, who listened with deep interest to an eloquent sermon by the Bishop of Stepney. No less than 162 institutions and 80 dispensaries receive assistance from the Fund, and we are glad to see that several smaller hospitals are this year included in the list of grants. The persistent neglect of small institutions has always seemed to us a serious defect in the administration of this most excellent fund. Mr. George Herring has once again announced his intention of adding threepence to every shilling collected.

Livingstone College.

SPEAKING at the Commemoration Day Proceedings at Livingstone College on May 31st, Mr. Cantlie emphasised the very great importance of training in elementary medicine, surgery and hygiene to missionaries going to uncivilised lands. Many of them, as he pointed out, left their homes to die for Christianity; but he considered it a nobler aim to live for Christianity, and the College had been established for the purpose of teaching men how to live. He compared the course of training to the St. John's Ambulance course, and showed that whilst in England accidents were of frequent occurrence there were comparatively few mishaps of this kind in lands where there were no mines, manufactories, or wheeled vehicles. In tropical countries, however, disease struck down its victims with terrible suddenness, and it was necessary that ordinary missionaries should know how to deal with the most common diseases. People said that a little knowledge was a dangerous thing, but, like the teaching of the St. John's Ambulance, the course at Livingstone College was complete of its kind, and it gave to missionaries exactly the teaching which they required in medical subjects, and he considered that no missionary should go abroad without some such training. He regretted that the chief missionary

societies had not taken the matter up in the way that they should do, and he considered that many of them were trading on the religious fervour of their representatives through sending them out without proper equipment in the way of medical knowledge, and in so doing he considered that they were juggling with human lives.

Which is the Mother?

"It is a wise child that knows its own father," runs the proverb, but never hitherto has popular philosophy doubted the relationship of the child to the woman who bore it. It has been left for American surgery to help to bring into the world an infant whose maternity is, to say the least of it, debateable. The case is reported in the *New York Medical Record* of May 5th of this year. A married woman, who after a miscarriage developed signs of cirrhotic ovaritis, had her ovaries removed by Professor R. T. Morris so effectually as to assure the operator that no vestige of ovarian tissue remained behind, nor was the least particle allowed to contaminate the peritoneum. After this had been done, portions of the healthy ovary of another woman just removed during an operation for uterine prolapse were grafted into the broad ligaments. This was in 1902. The patient bore a healthy infant in March 1906! Professor Morris appears to regard his handiwork merely in the light of an interesting experiment, but obvious fallacies apart, and assuming that the facts are as he believes, the vista opened up is uncommonly extensive. Suppose it should prove possible, as he hints, to cure sterility thus, or to restore fertility to a woman past her climacteric. The dynasty tottering to extinction for want of an heir would take heart again. Collateral heirs would contest, even to the House of Lords, the entailed rights of the Isaac sprung from a heteroplastic graft. The new operation might even become as fashionable as appendicectomy, and no longer need the worn-out aristocracies of Europe seek to escape annihilation by admixture with the healthy blood of the actress and American heiress. But the matter has a serious side. If the discomforts, even dangers, accompanying an artificial menopause can be obviated by ovarian grafting, the benefit of the procedure is undeniable; but if a possible pregnancy, in which the woman conceives a child of whom, biologically, she is not the mother, no right thinking man would incur the risk of such a contingency without explaining to man and wife the descent of future offspring. Professor Morris (though he wonders "which parent" the child of his patient will most resemble) writes that "the mother who has borne the child is the real mother, as she furnished the nutriment for the development of the child," and perhaps the common law of England would regard such an offspring as the "heir of her body." But it took the wisdom of Solomon to settle one case of disputed maternity—and Solomons are rare in these days.

University of Dublin—Proposed Honorary Degrees for Medical Men.

At a meeting of the Senate of the University held on June 14th it was decided to confer the Honorary Degree of Doctor of Medicine on Sir Richard Gowers, K.C.B., M.D., F.R.S.; and of Doctor of Science on Colonel David Bruce, M.B., C.B., F.R.S., R.A.M.C., and on Dr. Almroth Edward Wright, M.D., F.R.S. These degrees will be conferred on the third of next month.

PERSONAL.

PRINCESS CHRISTIAN presided last week at the annual meeting of the Council for the Promotion of the Higher Training of Midwives.

DR. R. MURRAY LESLIE, Physician and Pathologist to the Royal Hospital for Diseases of the Chest, has, on the recommendation of M. Cambon, the French Ambassador in London, received the Order of "Officier d'Académie Française."

THE RIGHT HON. R. B. HALDANE, K.C., M.P., his Majesty's Secretary of State for War, has kindly consented to distribute the prizes at the London Hospital Medical College on Friday, July 13th.

THE prizes to the students of St. Thomas's Hospital will be presented on June 27th, at 3 p.m., by Professor William Osler, F.R.S.

DR. J. S. HALDANE, F.R.S., has been appointed by the King one of the Commissioners to report on certain questions relating to the health and safety of miners and the administration of the Miners' Acts.

MR. BURNETT MAY has been appointed honorary consulting surgeon to the Queen's Hospital, Birmingham, an institution to which he has rendered valuable services for many years.

STANLEY B. ATKINSON, M.B., of the Inner Temple, has been placed on the Commission of the Peace for the County of London.

DR. PERCY AUSTIN RODEN has been made a Justice of the Peace for the borough of Droitwich.

DR. HUMPHRY has been re-appointed Lecturer in Medicine of the University of Cambridge for five years.

PROFESSOR SIMS WOODHEAD has been appointed to represent the University at the dedication of the new buildings of the Harvard Medical School on September 25th and 26th, 1906.

SIR DONALD CURRIE on June 11th laid the foundation stone of the School of Advanced Medical Studies Nurses' Home and Maternity Students' House at London University College Hospital.

In the "Honours Tripos" Cambridge University list, published on Monday last, we are glad to see the name of Howard Simson Tindall, son of Mr. A. A. Tindall who has for forty years been connected with THE MEDICAL PRESS AND CIRCULAR.

THE Raymond Horton Smith prize for 1906 for the best thesis for the degree of doctor of medicine presented during the academical year at Cambridge has been awarded to Harold Theodore Thompson, M.A., M.B., B.C., the subject being: "On certain changes in sensation associated with gross lesions of the spinal cord."

DR. JOHN PHILLIPS was last week elected a consulting physician to the British Lying-in Hospital, on his retirement from the post of physician to in-patients, after a service of some twenty-five years.

A CLINICAL LECTURE ON PELVIC TUBERCULOSIS.

By HENRY JELLETT, M.D., F.R.C.P.I.,

Gynæcologist and Obstetrical Physician to Dr. Stevens Hospital, Dublin.

GENTLEMEN,—In my lecture of to-day I propose to discuss the subject of pelvic tuberculosis, and to illustrate my remarks by the clinical records of three patients whom I shall show you, and who were recently under my care in this hospital. Perhaps I should commence by saying that for my present purpose I propose to limit the meaning of the term "pelvic tuberculosis," to tuberculosis of the tubes, the ovaries, and the pelvic peritoneum, excluding all reference to tuberculosis of the uterus or bladder, though this condition should, strictly speaking, also be included under the heading.

There is no doubt that the Fallopian tube is by far the most common site of primary genital tuberculosis, and that the most common seat of secondary extension from the tube is the ovary. I think perhaps that I may even go a little further than this and say that in women between twenty and forty years of age the uterine appendages are the most common site of intra-abdominal tuberculosis. At the same time, the distinction which I have drawn between primary and secondary infection must be clearly noticed; for it is a curious fact that while the tube is one of the most common sites of primary infection in the female, the ovary is one of the rarest. A few cases have been recorded in which primary infection of the latter was noticed without an accompanying infection of any other part of the body, but they have been very few and they are always open to the criticism that the true primary site of infection has been overlooked.

The manner in which tubercle bacilli reach the tube, in the first instance, has for long been the subject of discussion. In some cases, where the tubal infection is secondary to a general peritoneal infection, the route is obvious and is one of direct extension. In other cases, and they perhaps constitute a majority, in which there is no primary focus from which direct extension can occur, the mode of infection is more difficult to explain. Such cases may be divided into two groups:—one group formed by those cases in which there are tuberculous lesions elsewhere in the body, but not in direct contact with the tubes; and a second group formed by those in which no such primary focus of infection exists.

In the first group, bacilli are doubtless often carried through the blood or lymph stream according to the primary site of infection, and they reach the Fallopian tubes by these routes as they reach other parts of the body. The answer to the question, "Why should the tubes be so frequently selected for the deposit of infection?" will, I think, be difficult to find. The fact that they are so frequently selected goes to prove that the resistance they offer is lower than that offered by the other tissues of the body. This is, however, but a shifting of one of the question, for to the further question, "Why is the resistance of the tube lower?" we have at present no answer.

There are, however, in addition to the blood and lymph streams, two other routes which can be followed by bacilli which have already gained entrance to the system. These routes were specified by Hegar, who distinguished them as "ascending" and "descending." These terms do not require explanation further than to say that in following the ascending route the bacilli ascend through the vagina and uterus into the tubes, and in following the descending route they descend from the peritoneal cavity into the tubes. In other words, the ascending route is that followed by

the spermatozoa, the descending route that followed by the ovum. The descending route is readily understood, since we know that microscopical particles deposited in the peritoneal cavity tend to find their way into the tubes, being helped along by a serous current. In this way, bacilli which have passed through the intestinal walls into the peritoneal cavity, or which come from peritoneal infections, may be carried downwards until they come to lodge in one of the numerous recesses between the folds of tubal mucous membrane.

The ascending route is more interesting, and is perhaps of more importance, from the fact that both primary and secondary infection can be carried by this route and also that prophylaxis may be of value in preventing infection from travelling along it. Primary infection by this route may occur if tubercle bacilli are carried into the vagina or uterus by the fingers or instruments of the gynæcologist, or if they are deposited there in the semen of a man suffering from tuberculosis of the genital tract. It is also possible that bacilli may find their own way into the vagina from without and be carried upwards by the ascending mucous currents, which, according to Mr. Bond, exist in the vagina and other mucous canals. These bacilli may come from an entirely heterogenetic source or may have been first brought into the region of the vulva from other tuberculous lesions, more especially in the intestine or urinary tract. It is interesting to ask ourselves why, if infection of the tubes really occurs by the ascending route, there are so few cases of tubercle of the endometrium? I think that, if not a reason, at any rate an explanation may be found in the anatomical structure of the tubal mucous membrane, which affords so perfect a nidus for an infecting organism, while, on the other hand, not only does the smooth surface of the uterus not afford the same recesses in which organisms can lodge and grow, but even the shelter which it does afford is swept away each month.

So much, then, for what we know of the origin of tubal tuberculosis. There is a great deal of fairly probable surmise, and very little certainty.

What are the symptoms of pelvic tuberculosis? I think that perhaps I can best lay before you those that are usual by discussing the histories of the three patients whom you see. I may preface what I have to say with the statement of my own opinion that there are no special symptoms or groups of symptoms which can be regarded as pathognomonic of tuberculosis of the appendages, or which will enable us to make a diagnosis prior to operation between this condition and tubal and ovarian infection of any other kind. This is an important matter to remember when we are considering the advisability of operating in any case of adnexal infection, and I shall return to it later.

The first patient, E. W., is æt. 34. She has been married for seven years and has never been pregnant. She came to seek my advice in the first instance because she had suffered for a considerable time from a pain in the lower part of the abdomen and the back, which pain was commencing to affect her general health. She had menstruated regularly in the past, but the amount lost at each period was excessive. On examination under an anæsthetic, I found that the uterus was normal in position, but softer than is usual; that the left ovary was enlarged to three times its normal size; and that the right ovary was apparently normal in size but fixed. There was also evidence of the existence of adhesions, and of tubal thickening.

There was not, however, and to this I again direct your attention, any evidence to suggest that the case was tubercular in origin.

Three days later I opened the abdomen, and then found that the left ovary was enlarged to the size of a hen's egg; that the fimbriated extremity of the corresponding tube was adherent to the rectum, and that the tube itself was thickened and was as large as a finger; that the right ovary contained a number of small cysts; and that the right tube was in a similar condition to the left tube, save that a number of "sago grains" were scattered over it and over the adjacent intestine. I then removed the left ovary and both tubes, and also incised the right ovary and resected the cysts it contained. Finally, I made sure that the stumps of the tubes left behind were patent by passing a probe through them, and then closed the abdomen. The patient's convalescence was afebrile, and I removed the sutures on the eighth day. As you can see, her condition is now excellent and she will leave the hospital to-morrow, that is, seventeen days after the operation. The pathologist, Dr. Rowlette, has examined the removed appendages and reports the case to be one of tuberculosis. I have little doubt that this woman's after-history will be satisfactory, and that there will be no return of the trouble. Owing to the early operation one ovary has been spared, and, consequently, she will be free from the unpleasant consequences of a premature menopause. Had the operation been postponed, under the belief that the local conditions could be relieved by other means, when the time for operation eventually arrived the operation necessary would have been very different from that I have described, and would certainly have left the patient *minus* both sets of appendages and probably *minus* her uterus also.

The second case to which I wish to direct your attention is one in which genital tuberculosis is associated with tuberculosis of one ureter. Which condition is the primary one it is hard to say, but I fancy that the genital tuberculosis is. I think I am right in saying that ureteral tuberculosis is usually secondary to renal tuberculosis, and in this case careful and direct palpation of the kidney has failed to reveal any evidence of this condition, nor does microscopic examination of the urine elicit any such evidence. The patient, M. F., unmarried, æt. 24, came to me complaining of pain in the left side and difficulty in passing water for the last six weeks. She menstruated normally, but somewhat too heavily, and she suffered pain during and after the occurrence of the discharge. On bi-manual examination, a small and firm swelling fixed to the left side of the bladder and apparently lying on the tract of the left ureter could easily be felt, and on examining Douglas' pouch, it was found to be occupied by a somewhat similar swelling, apparently formed by the appendages. The uterus was retroverted. The urine, which was slightly cloudy, was examined on several occasions, and at times was found to contain slight traces of albumin and pus, and at times was free from both. At no time were any tube casts seen. I made a cystoscopic examination of the bladder with Nitze's cystoscope, and found that while the right ureteral orifice and the greater part of the bladder wall was healthy, the region of the left orifice was markedly diseased. At this spot the mucous membrane appeared to be covered with numerous granulations, and the ureteral orifice suggested rather the opening of a sinus into the bladder than a ureter. In consequence of these appearances I diagnosed the case as one of tubal and ovarian inflammation, and considered that the swelling adherent to the bladder was formed by a pus sac which probably opened into the bladder.

On opening the abdomen the condition of the pelvic organs was found to be very much as I have described, save that the swelling beside the bladder was quite separate from the appendages and obviously was formed round the ureter. The swelling in Douglas' pouch was formed almost entirely by the left appendages, those on the right side being comparatively healthy. A loop of

the pelvic colon was prolapsed into Douglas' pouch, and had become densely adherent to the back of the enlarged appendages at three spots. As a result of the adhesions, the intestinal wall was drawn out into nipple-like projections, and the tops of these projections were caseating as a result of the extension of the tubal infection. In consequence, when separating the adhesions, the top of each projection was in turn torn off, and three openings into the pelvic colon resulted. As, however, the loop could easily be drawn into the wound, the openings were successively closed without difficulty, and never gave any trouble. Ventro-fixation by Kelly's method was then performed and the abdomen closed, the right appendages being allowed to remain.

Dr. Rowlette examined the removed ovary and tube, and reported that they showed typical tuberculous changes. The patient made an excellent recovery in spite of the formation of a small abscess in the abdominal wound. From this about three ounces of pus escaped, and though the abscess cavity itself quickly healed, the skin wound took some weeks before complete union resulted. Since the operation, I have examined the bladder twice with the cystoscope, and the granulations round the left ureter have almost completely disappeared, with the result that the ureteral orifice is now plainly visible. The ureteral swelling has also slightly diminished in size.

The third case is very different from the foregoing cases. M. C., æt. 22, has been married for the past three years, and has had two children. The second of these was born three months ago. Since then, she has complained of severe pain in the right iliac fossa, and of profuse discharge from the vagina. She has also been steadily losing flesh. On examination, the uterus was found to be directed backwards and to the right, while behind the uterus and filling Douglas' pouch there was a swelling corresponding in size and position to that usually formed by inflamed and pus-containing appendages. As the patient had a hectic temperature, I decided to try to drain the tubes through the vagina, with a view to their future removal, and, accordingly, I made an opening from the posterior vaginal fornix into Douglas' pouch. There was considerable difficulty in getting into the pouch, and on finally doing so, I found that it was occupied, so far as its lower part was concerned, by a mass of friable tissue. This tissue could be separated easily enough from the bottom of the pouch, but as I could not remove it completely I took away a small piece for examination and plugged the hole I had made, intending to complete the operation on another day by the abdomen. On examination of the removed tissue, it was reported to be tuberculous.

A week later I opened the abdomen and found the intestines and appendages matted together with every evidence of advanced pelvic tuberculosis, which was also commencing to extend upwards into the abdomen. With considerable difficulty the uterus and adnexa were removed. In the course of the operation, a sac containing very foul pus was opened and the pelvis infected by it. In separating an adhesion the rectal wall, which was softened and apparently infiltrated by tubercle, was perforated, and a fistula resulted. As was only to be expected from the nature of the case, the abdominal wound became infected and localised abscesses also formed in the region of the appendix and in Douglas' pouch. These abscesses were drained both through the vagina and through the abdominal incision.

As after two months there was no appreciable improvement in the patient's condition, and as her temperature still remained high and she was fast losing ground, I decided to re-open the abdomen with the object of trying to reach another collection of pus which I believed to be present. On doing so, however, I found the abdominal peritoneum extensively covered with nodules of tubercle, and the intestines to be universally adherent. In endeavouring to separate some of these adhesions my finger passed through the wall of a portion of small intestine which was as soft as a

piece of wet blotting-paper, owing to tuberculous infiltration. As it was impossible to draw the torn loop up to the abdominal incision to suture it, I had to make another opening over it and I then sutured the tear. The condition of the intestinal wall was, however, such that I did so without any hope of success.

The patient, who possessed a most marvellous vitality, rallied after this operation, and for a time seemed to improve. The fistulæ closed to a considerable extent, and she was able to go to a convalescent home. You now see her on her return from there. Her condition is very poor. The abdomen is markedly retracted, and she is very thin. The recto-vaginal fistula is practically closed, but the small intestine discharges through both abdominal wounds. There is no prospect of being able to make any attempt to close them in view of the condition that exists inside the peritoneal cavity, and, indeed, the evidence points to the spread of the tuberculous infection and to a fatal termination of the case in the near future.

Here, then, you see a direct contrast to the first case. It is probable that the patient herself was far less resistant to the infection than was E.W., and that the infection occurring immediately after child-birth had more favourable opportunities for its extension. This woman, however, had been under treatment for some weeks before I saw her, under the idea that the tubal condition was due to an ordinary puerperal infection, and would abate if given time. I cannot help thinking that if she had been operated upon immediately, both the operation itself would have been more simple and its after-results more satisfactory.

I think, Gentlemen, that these three cases which I have shown you to-day are sufficient for the purpose in view, namely, to show you the different clinical aspects which genital tuberculosis may assume. In the first case, you have seen one of uncomplicated genital tuberculosis in which early operation has been performed with the best results. In the second case, you have seen one of a complicated genital tuberculosis in which early operation has been performed with good immediate results, but with more problematic results as regards the future. In the third case, you have seen one of complicated genital tuberculosis in which operation was delayed. The results, as you have seen, have been most unsatisfactory, and any material improvement in the condition of the patient is unlikely.

Perhaps I might with advantage have mentioned one other patient on whom I recently operated for pelvic peritonitis, and in whom I found evidences of a pre-existing and slight infection limited to the tube. In her case, the "opsonins" developed in the body apparently had proved capable of overcoming the tubercular infection, with the result that the only trace that was left of it, if I overlook for the moment indirect traces such as pelvic adhesions, were several small calcareous masses which blocked the lumen of the tube and caused sterility.

Before concluding, I must add a few words on the treatment of these cases. I am afraid that we must start with the acceptance of the fact that there is no means of diagnosing the existence of genital tuberculosis prior to operation, save perhaps in those cases where the infection has extended so far as to invade the general peritoneal cavity and cause symptoms of tuberculous peritonitis. From the sole point of view of whether we are to operate or not, I do not know that this failure of diagnosis is of any very great importance, since, even if the enlargement of the appendages is caused by some other form of infection, operation will probably be required. It is, however, a misfortune that we cannot always definitely and at once tell the nature of the infection while we are operating, because if the infection is tuberculous it is often advisable to perform a more radical operation than would otherwise be the case. Occasionally, too, the opposite may happen, and we may be led to carry an operation for tubal infection further than is actually necessary, because we have mistakenly made a clinical

diagnosis of tuberculous infection. It is true that, in many cases, the nature of the case is made clear while we are operating by the presence of sago-grains on the peritoneum, but in their absence I freely confess that I have repeatedly, during operation, believed that the case was one of tuberculous infection when subsequent examination proved that it was not, and *vice versa*.

As a general rule in operating on salpingo-oöphoritis, I would lay down as a guiding principle to remove all diseased tissue and to spare all that is healthy or that is capable of recovery. This may seem an obvious truism, but it by no means follows that it is always acted upon. There is, I think, a tendency to regard as diseased an ovary held down by adhesions, or congested in consequence of tubal disease or uterine displacement, and to remove it *en masse* with the tube. My point is that much of the odium that has been attached to operations on the appendages is the result of indiscriminately removing the latter without pausing to separate the diseased from the healthy, or the organs which are necessary to the future well-being of the woman from those with which she can dispense without discomfort. The same remarks apply to the uterus. If it is diseased, remove it without hesitation, but do not remove it merely because someone has expressed the opinion that the removal of inflamed appendages is useless unless the uterus is also removed. I am quite prepared to grant that such operations are useless if the uterus is allowed to fall back after them into Douglas' pouch and to become adherent there. It is, however, a much easier matter to perform ventral fixation or suspension than to remove the uterus, and if to the relieved uterus is added the ovary or even portion of an ovary which has been spared, and perhaps the patent stumps of the Fallopian tubes, a woman is left with her genital functions perfect instead of being *minus* organs whose presence is necessary to her comfort.

These are the principles which I would recommend you to adopt in dealing with non-tuberculous salpingo-oöphoritis, and if you adopt them in such cases you will find that you will also adopt them in most tuberculous cases because you will be unable to make an exact diagnosis during operation. If you can make such a diagnosis, then the same principles will still govern you, save that the term "diseased tissue" may be extended to include any tissue in which there is evidence of tuberculous infection.

If there are small caseating patches in or on the ovaries, the latter must be removed and so also must the uterus if in a similar condition. If there is a collection of pus in the pelvis, it is also an indication for the removal of the uterus in order that free drainage into the vagina may be possible.

The questions should we drain in these cases, and, if so, by what route are interesting ones, but time forbids me from entering into them to-day. So far as my own practice is concerned, they may be answered in a few words. I never drain by any route unless there has been a considerable amount of pus in the pelvis, or unless there are necrotic and pyogenic areas which cannot be entirely removed. In such cases, I drain by the vagina either through an opening in Douglas' pouch or through the gap left by removing the uterus. I never drain through the abdominal wall.

Of course, if all that Professor Wright claims for opsonic treatment is true, there will be a tendency to abandon the operative treatment of tuberculous lesions in favour of serum treatment. I do not think, however, that such a tendency will establish a lasting principle, since even if the tuberculous infection is removed, how can it be expected that the serum will also remove all trace of the resultant lesions? If the serum does not do so, the gynaecologist will still be required to remove abscess formations and to bring about a radical cure of the uterine and ovarian malpositions which have been caused by the contraction and healing of the tuberculous areas.

NOTE.—A Clinical Lecture by a well-known teacher appears in each number of the journal. The Lecture is.

next week's issue will be by Arthur Whiting, M.D., M.R.C.P.Lond., Dean of the North-East London Post-Graduate College, Physician to the Tottenham Hospital, and to the Mount Vernon Hospital for Diseases of the Chest, on "The Clinical Examination of the Blood."

ORIGINAL PAPERS.

ON THE FULMINATING FORM OF APPEN- DICITIS

SIMULATING THE ONSET OF A SEVERE
ATTACK OF EPIDEMIC INFLUENZA OR
OF ACUTE PNEUMONIA, AND ITS suc-
CESSFUL TREATMENT BY IRON
ACETATE AND BELLADONNA.*

By HERBERT J. ROBSON, M.R.C.S., L.R.C.P.,
Leeds.

THE following symptoms typify the class of case referred to under the above heading: sudden abdominal pain which may or may not be referred to the right iliac fossa; rigor, a smart attack of fever, the temperature running up to about 103° F., or even 104.6° F., the pulse to 100, or considerably over 100, and the respirations to 20 or 22; severe headache and backache often contemporaneous with the abdominal pain. Nausea and vomiting may or may not be present, and tenderness upon pressure is usually if not always elicited over the appendix region. The patient looks ill and has often a pinched, peritoneal look. There is often albumin in the urine, and, as a rule, constipation exists.

But for the abdominal pain and tenderness and the pinched expression the case might be easily mistaken for a severe attack of epidemic influenza, or even for the onset of acute pneumonia; though, as proving that it is not the latter disease are the facts that the respiration-rate only registers twenty or thereabouts and there is an absence of cough, chest pains or chest signs.

Such are the cases that in my opinion, if not actively treated by iron acetate and belladonna and a carefully-considered dietary, rest, &c., will in all probability go on rapidly to suppuration and necessitate operation; and such are the cases that, if actively treated from the commencement by iron acetate and belladonna, a nourishing non-starvation diet, rest, &c., will, as a rule, clear up without operation. I am aware that this is rather a sweeping statement to make; but after having carefully watched and noted this class of case during the last twenty-five years, both in bed and on the operating-table, and particularly since about 1890, I feel justified in making it. I have seen such cases treated by the expectant and semi-starvation method, and I have seen them treated as though they were severe cases of epidemic influenza; but generally, I believe I may say always, with the same result, viz., suppuration.

On the other hand, if it is thought expedient to operate at any time after the commencement of the medical treatment, the patient will be in a better condition to bear operation if he has previously had the iron acetate and belladonna treatment here advocated than he would had only the expectant treatment and the semi-starvation diet been adopted.

I argue that these cases of fulminating appendicitis require as much distinction from catarrhal appendicitis as does a case of pneumonia from a case of bronchitis, or as does a case of suppurative tonsillitis (or quinsy) from a case of follicular tonsillitis, both as regards prognosis and treatment. This type of case, in fact, is a very different thing from the ordinary case of catarrhal appendicitis, where the symptoms are much less marked, where no albumin is present in the urine, and where there is often not the rigor and never the severe headache and backache; and as such I think it deserves distinctive note and treatment. Clinically it resembles, as previously stated, the onset of a severe attack of epidemic influenza or of acute pneumonia, and one might almost expect to find that the influenza bacillus or Fränkel's pneumococcus was the cause of the trouble. Judging by clinical experience alone, I would even go further and assert that there are two forms of this fulminating appendicitis, viz., an influenzal form and a pneumococcal form, and that the latter is the more severe; but that the treatment here advised is equally applicable to both. Furthermore, I believe that this pneumococcal appendicitis (if such I am justified in calling it) sometimes complicates pneumonia (particularly apical pneumonia) and causes the acute abdominal symptoms occasionally observed in these cases, and which may be mistaken for typhoid complications; though I have not yet been able to verify this by *post mortem* examination.

The treatment advocated for the disease is as follows:—First of all the patient, or the friend of the patient, is told what the case is, and he is given the option of immediate operation, and also the option of a consultation with an operating surgeon. If necessary, and if external local applications fail to ease, a dose of morphia is given in as small a quantity as possible to relieve pain; gr. ½ of extract of belladonna is given every three hours until physiological symptoms are produced, when it is administered less frequently, and the following mixture is given every three hours in water:—

R Liquor ferri perchlor., 15 m.;
Liquor ammonii acetatis, 2 drachms.;
Aq. chloroformi, ad. ½ oz.

Ft. mist.

To relieve the headache hot applications are used, and to ease the backache—if such be present—a hot rubber bottle is applied; but, if possible, the coal-tar derivatives are avoided, as I believe them to be positively harmful in this complaint. Warmth is applied to the abdomen over the region of the appendix, turpentine stupes being often used with advantage. I believe the topical application of cold often does harm in these cases, particularly if the appendicitis is of influenzal origin; though one could understand its doing good if the case were of pneumococcal origin. But the difficulties of diagnosing this point are great; therefore the safest application is warmth. A rectal soap enema is given to relieve constipation, half an ounce of turpentine, mixed with an egg, being added to this if tympantites be present. Purgatives are of course avoided. Strict rest in bed in the recumbent posture is enjoined. The temperature of the bedroom is kept at 60° F. night and day, and a light, fluid, nutritious diet, and one producing little residue is given.

* Read before the International Congress of Medicine at Lisbon.

In my earlier days of practice I used to see appendicitis treated by a semi-starvation diet, as it was then thought that the operating surgeon would have a better chance of a successful result if such a dietary course were followed out, and should the case ultimately require operation; but I have long since failed to see either the benefit or the wisdom of it in these cases of fulminating appendicitis, as I think that they in particular demand a highly nutritious though light and fluid diet, but at the same time one leaving as little residue as possible in the intestinal tract.

I could give notes of several cases, comparing those in which the above treatment was successfully adopted without operation, and those in which only the expectant treatment was followed out and which speedily suppurred, thus, of course, necessitating operation; but lack of spare time prevents me from doing this now. I therefore only submit the bare facts and general *résumé* of my experience in these cases; though I hope upon some future occasion to have the opportunity of publishing the cases in detail.

I look upon the administration of the belladonna as an important adjunct in the treatment, not only on account of its sedative action upon the intestines, but also because of its anti-suppurative action, as pointed out by Christopher Heath, Ringer and others.

TUMOURS OF THE BLADDER:

WHY OPERATIVE TREATMENT IS SO FREQUENTLY UNSUCCESSFUL IN ITS REMOTE CURATIVE RESULT—A PLEA FOR EARLY DIAGNOSIS.*

By DAVID WALLACE, C.M.G., M.B., C.M., F.R.C.S.ED.,

Assistant Surgeon, Edinburgh Royal Infirmary; Examiner in Clinical Surgery, Royal College of Surgeons, Edinburgh.

THAT vesical tumour is by no means a rare malady is shown by the large collections of reported cases made for statistical purposes. One surgeon has operated on nearly 400 cases, and I have myself had experience of more than fifty cases. The results of operation, as shown by statistics, are very disappointing, for it is rarely that patients survive for very long without recurrence, and it is towards this point—a plea for early diagnosis as a means of improving the prospect of removal—that my remarks will be chiefly directed. Vesical tumours are commonly classified as papillomata, carcinomata, sarcomata, adenomata, and as rarer forms, myomata and angiomata. Malignant growths are much more common than simple tumours, and carcinomata than sarcomata. In benign tumours the operative mortality is about 17.7; in malignant cases about 29 per cent. One of the explanations of the unsatisfactory results of operation is probably the site which they commonly occupy—the floor of the bladder, where free excision is difficult, and dangerous from the risk of wounding the ureters. An additional circumstance, favouring recurrence is the long duration of the symptoms in many patients before surgical aid is sought. He (the author) remarked that he wished to draw attention to the importance of employing cystoscopy at the earliest onset of bladder symptoms; the procedure was easy of performance, harmless,

and comparatively painless. By cystoscopy information of great value in giving a prognosis—such as the site of the tumour or tumours, the size of their attachment, and their nature, malignant or simple—could be gleaned. As to the general rule governing palliative operation, the following were some of the guiding principles. Delay operation as long as possible in unfavourable cases, operate in septic cases. Severe hæmorrhage indicates operation; suprapubic cystotomy relieves the symptoms, drains the bladder of septic material, and prevents hæmorrhage. Frequency of micturition is abolished, and the patient is enabled to go about in comfort wearing a suitable urinal.

Canceroidal Tumours are usually infiltrating and ulcerative. The early symptoms to which they give rise are those of cystitis—frequent and painful micturition, while hæmorrhage occurs later. They affect chiefly men in later life, fifty being the average age. On rectal examination the hard mass may be felt in the base of the bladder. Cystoscopic examination is often difficult on account of the infiltration of the bladder wall and the contracted state of the organ. Only palliative operation is possible, as the growths invade neighbouring organs. *Papillomata* are either fimbriated or warty, the former being frequently pedunculated, the latter usually sessile. The hæmorrhage to which they give rise is not always typical. Not infrequently the blood is uniformly mixed with the urine, and simulates the hæmaturia arising from renal disease. The diagnosis therefore depends on cystoscopic examination. Since these tumours are benign operative treatment ought to be curative, yet, as is known, recurrence is very frequent. It is a not uncommon experience to find that after one of these papillomata is removed the symptoms reappear, and on cystoscopic examination more than one villous tumour is found at the old site. The reasons why removal is so often followed by this unsatisfactory result are probably, first, the fact that cases are not operated on early enough; second, the site of the tumour, in the trigone, near the ureter, preventing free removal, and, third, failure completely to remove the mucous membrane round the base of the growth. By the use of a rectal bag, the employment of the Trendelenberg position, and by having a good light thrown into the bladder from a head lamp, the difficulties connected with the position of the papillomata can be largely overcome. The difficulties in prognosis are illustrated by two cases, in one of which a tumour was thoroughly removed with a large piece of adjacent mucous membrane right down to the muscular layer of the bladder wall. Pathologically it was pronounced benign, yet it recurred in the form of multiple growths on two successive occasions. On the other hand, a case had been operated on in which it was impossible, apparently, completely to extirpate the tumour; the growth was pronounced by the pathologist to be epitheliomatous, and yet no recurrence took place, though a number of years had elapsed.

The Medical Officers of Schools Association has issued (through Messrs. Churchill) a pamphlet containing reprints of two addresses delivered before it by Mr. T. C. Horsfall and Dr. Herringham. The subjects dealt with relate to physical training in schools, and these addresses will be read with profit by all who are interested in physical education.

* Abstract of Paper read before the Edinburgh Medico-Chirurgical Society, June 6th, 1906.

CLINICAL RECORDS.

TWO CASES OF ADDISON'S DISEASE AND THE EFFECT OF THE ADMINISTRATION OF SUPRARENAL EXTRACT.

By A. GORDON GULLAN, M.D.Lond., M.R.C.P., F.R.C.S.,

Lecturer on Clinical Medicine, University of Liverpool; Physician to the Liverpool Stanley Hospital.

As the value of suprarenal extract in the treatment of Addison's disease is still *sub judice*, I think that the results obtained by the administration of this medication in two cases of that disease which have recently been under my care will be of interest.

CASE I.—Joseph G., a young butcher, æt. 18, was admitted into the Stanley Hospital on September 7th, 1903, complaining of pains in the epigastrium, vomiting, and weakness. His face was sallow, and his pulse was extremely small.

There was no history of phthisis or tubercle in his family. The lad stated that he had always been healthy till the present illness, which began, according to him, two months prior to admission, when he was troubled with severe aching pains in the epigastrium following food, but this was relieved by vomiting after each meal. He said that he had lost flesh during his illness and become very weak; he also noticed that "his skin was yellow."

On admission.—Patient was a thin but well-developed youth; his face and hands were cold and livid; temperature subnormal, 97° to 98° F.

There was a large amount of pigmentation of the skin over the body, especially marked in certain regions (*vide chart*), namely:—

The exposed parts: Neck as far as the collar, where it ended abruptly, and the back of the forearms, where it gradually shaded off.

The normal sites: Deep pigmentation of the axillæ, nipples, penis, and scrotum.

The parts exposed to pressure: The lumbar region of back, specially the lumbar spines, about the knees, the soles of the feet, and also in two scars on the back of the left forearm.

The pigmentation was of a yellowish brown or copper tint, shading in some regions to a dark brown, and reaching a maximum in some small black pigmented spots scattered about the chin, lips, back, and ankles. There was also some copper-coloured mottling on the mucous membrane of the cheeks and gums.

There was tenderness in the epigastrium and left hypochondrium on deep pressure, and a distinctly tender spot was found over the eleventh and twelfth ribs posteriorly, on each side (3 ins. from the spine on the right and 2½ ins. on the left).

The pulse was 80 per minute, extremely small, very low tension, but regular. At no time could a sphygmographic tracing be obtained. The cardiac impulse was absent. There was no superficial dulness, and the deep dulness only extended 3 ins. to the left. The heart-sounds were clear at all areas, but distant. Liver dulness was 4 ins. in the nipple line. Splenic dulness normal. He had no cough, and the respirations were 20 per minute, otherwise normal. The urine was acid, scanty, high-coloured, contained urates on standing, and sometimes a trace of albumin. The quantity of urea was relatively greatly increased. The muscular system was flabby, but there was not much wasting.

After admission, our immediate object was to stop the persistent vomiting, so he was placed on a very light diet, and 10 grs. of bismuth carbonate were given just before food, with the desired effect for a time. On September 14th, extract of suprarenal in gr. 5 doses was given thrice daily, and this was increased to gr. 10 a few days later. On October 2nd the suprarenal extract was increased to gr. 15, and the patient had improved. He had no pain, and had not been sick for a week, and his pulse was a little stronger. This improvement was maintained till October 19th; but he was steadily losing weight—about 2 lbs. per week—and the pigmentation in the mouth was more marked. On that date the vomiting returned with all its severity; he complained of acute pain in the abdomen and in both lumbar regions, pressure under the last rib on each side causing him to jump and cry out. The pain was so intense on October 22nd that he lay curled up in bed groaning; he was very sick, and all medicines had to be stopped; hypodermic injections of morphine were given to relieve the pain, and some brandy. The muscular weakness was most pronounced at this time, and the deep cardiac dulness was found to have further diminished. He gradually became semi-conscious, and died on October 25th. The *post mortem* was made on the same day, and the report is briefly as follows:—Body extremely emaciated, marked pigmentation of the skin as noted during life. Lungs healthy, no evidence of tubercle, recent or old. Heart small, muscle substance atrophied, pale and friable, valves healthy. Stomach large and somewhat congested; bowels healthy. There was considerable matting of chronic inflammatory tissue in front of the aorta round the celiac axis and affecting the celiac plexus, the semilunar ganglia, the terminations of the greater and lesser splanchnic nerves, and extending outward to the suprarenal bodies. Both suprarenal glands were very much enlarged, nodular on the surface, and hard; on section both glands showed numerous caseous and fibrous nodules, varying in size from 5 to 15 mm. in diameter.

CASE II.—Mary R., a married woman, æt. 32.

Family History.—One brother died of phthisis. She has three children alive; one died of meningitis and another of diarrhoea. The present illness began two years ago, when she states that she was getting thin, low-spirited, and continually fainting; she also had great pain in both lumbar regions, particularly the left. As she had a severe attack of vomiting in January, 1904, she applied to the Stanley Hospital and was admitted. She was then noticed to have slight bronzing of the lower half of the face and neck. Her pulse was very small and easily compressible, and she had marked tenderness over both suprarenal bodies. There was general lassitude; her temperature was frequently subnormal, occasionally falling to 97° F. The tongue was coated, vomiting troublesome, and bowels rather constipated. She was placed on light diet, and calcium chloride and tincture of nux vomica prescribed. After three weeks she became an out-patient, and has remained so ever since, having been

readmitted, however, on two occasions (*i.e.*, in March and August, 1904). At the latter date her condition became worse, and the pigmentation was more marked on the face and neck, and also appeared on the backs of the forearms and on the hard palate, and she was also more subject to syncopal attacks. On August 5th she was ordered gr. 5 of suprarenal extract four times a day, and this was increased to 10 grs. and then 20 grs., thrice daily. This treatment was continued up to December 9th, with considerable benefit: she lost her lassitude to a great extent, had no fainting attack, her pulse was stronger, she vomited much less frequently, and the tenderness over the suprarenals was not so marked. She also gained in weight. On December 9th she was confined, and had a normal labour, the child being healthy.

She was then absent from the out-patient department for three weeks, and consequently the suprarenal extract was omitted for that time; and it is an interesting fact that the symptoms from which she had been free, *i.e.*, fainting, vomiting, and general lassitude, all gradually returned. On January 2nd of this year the suprarenal extract was recommenced, and the above symptoms steadily abated. She has been taking gr. 20 to gr. 30 of the extract regularly up to the present time, with great benefit. On another occasion, however, in April, she had a mild attack of bronchitis, when it was omitted for a short period while expectorants were given, and then her former symptoms returned and the pigmentation increased; these diminished when she took the extract again. She is now in fair health, has gained in weight, and only on occasions is troubled by vomiting or a syncopal attack. It is noticed that if she omits the suprarenal extract for only a few days, through not coming to the hospital, her pulse is always much weaker and her symptoms aggravated. This case, in the benefit she has derived from suprarenal extract given by the mouth, agrees with the two cases reported by Dr. G. Oliver (1) (though the bronzing has not improved to the extent which appears to have been apparent in his second case), and also with that recorded by Dr. Rolleston (2) in his admirable Gulstonian Lectures.

It also illustrates how the treatment must be continued, as laid down by Dr. Rolleston (3), and also that the suprarenal extract must be given in large doses. Dr. E. Lloyd-Jones records a case of Addison's disease (4) who was cured by taking twelve tablets per diem; my patient is taking eighteen tablets per diem.

The special points of interest in these cases are: (1) the severity and rapid progress of the disease in Case I., though the lesion was that of chronic tuberculosis of the suprarenal bodies plus secondary inflammation of the neighbouring sympathetic; and the little benefit derived from the extract; (2) the chronicity of the symptoms in Case II., and the considerable benefit derived from the suprarenal extract, so that she even easily stood the strain of pregnancy and parturition. These cases certainly lead me to support Dr. Byrom Bramwell's view (5), that those cases which improve on this form of treatment may be due to adrenal inadequacy alone, and the remainder are due to an additional lesion (I should like to word it, a secondary lesion) of the neighbouring sympathetic. This was the condition in Case I. But I cannot agree with Dr. Bramwell's suggestion that all those cases which improve have a non-tuberculous lesion (though some of them may have, as the one recorded by him); for it seems quite logical that, in the early stage of Addison's disease when of an undoubted tuberculous nature (and personally I have not yet seen a *post mortem* in which the condition was not of a chronic tuberculous nature), the disorder starts in the adrenal body and may lead to inadequacy of that body before the sympathetic plexuses are involved. At such a stage I believe treatment by suprarenal extract would be most beneficial, and if combined with good wholesome diet, fresh air, &c., the disease may be checked or cured; but then if, as a result, there

remains sclerosis of the adrenal bodies, the suprarenal extract would have to be continued to supply the internal secretion of the organ, probably for the rest of the patient's life. Hence the great importance of early diagnosis, and an early trial of this form of treatment in Addison's disease.

OPERATING THEATRES.

ROYAL FREE HOSPITAL.

SENN'S GASTROSTOMY. — MR. WILLMOTT EVANS operated on a man, *æt.* 50, who had suffered for about four months from difficulty of swallowing. This difficulty was at first slight but had steadily increased until about three weeks before admission. It had become completely impossible for the patient to take any solid food, though liquids could be swallowed with comparative ease. During the time that the dysphagia had existed he had steadily emaciated until at the date of admission he was extremely thin. He placed the site of obstruction at a point in the neck corresponding to the lower border of the larynx, and a bougie introduced through the mouth was arrested at about this situation. On palpation some indefinite thickening was felt behind the commencement of trachea, but no definite tumour could be made out and no enlarged lymphatic glands were discoverable. The man complained also of a troublesome cough and expectorated some amount of mucus, which was never blood stained. The diagnosis was made of malignant disease at the commencement of the *œsophagus* and it was resolved to perform gastrostomy; the patient consented after the nature of the operation had been explained to him. The patient's mouth was very septic and several teeth were loose; an attempt was made to improve the condition of the mouth by means of a tooth brush and a lotion containing Sanitas. The patient was anaesthetised and a vertical incision was made two inches in length about midway between the middle line and the left linea semilunaris, the upper end of the incision reaching to within three-quarters of an inch of the costal margin. When the rectus was reached the fibres were separated to the extent of the skin incision and the posterior sheath of the muscle, and the peritoneum having been divided the abdomen was opened. The stomach presented in the wound and it was identified by the attachment of the great omentum to its lower border and by the thickness of its wall. The viscus was then drawn up into the wound, and a point chosen about three inches from the greater curvature; here an opening a little less than a quarter of an inch in length was made, penetrating all the coats of the stomach; a piece of rubber tubing was next taken about ten inches in length of a size sufficient to pass through the opening fairly tightly, and this was passed into the cavity of the stomach to the extent of two inches: it was then fixed by means of a catgut stitch, which passed through the tube and also through the stomach wall; a purse-string suture of silk was then passed through the serous and muscular coats of the stomach about a third of an inch from the tube and was gently tightened, the rubber tubing attached to the opening in the stomach

being pushed in at the same time. A second, a third and a fourth purse-string suture was inserted in the same manner, each about a third of an inch outside the preceding one, and as each was tightened the rubber-tubing was pushed inwards; thus a cone of stomach wall was made to project into the cavity of the viscus and from the apex of the cone the rubber tube projected into the cavity of the stomach. A silk suture was then inserted as follows—it was passed through the anterior layer of the rectus sheath on one side of the wound, and then through the posterior layer, then through the muscular coat of the stomach and through the posterior and anterior layers of the sheath on the other side of the wound; this stitch was intended to fix the stomach firmly against the anterior abdominal wall and a similar stitch was inserted below the rubber tubing. The skin was sutured with silk and the wound dressed with sterilised gauze. Mr. Evans said that at the present time the original operation of gastrostomy was entirely abandoned as the simple direct opening into the stomach almost invariably leaked to a distressing extent and the ingenuity of surgeons had been exercised to devise methods which would not allow of any such leaking. There was little doubt that in this country at least Franck's operation was far more frequently performed than any other method of gastrostomy, but Mr. Evans inclined to prefer the method devised by Senn which he had just employed. Kader's method, he said, was similar in principle to Senn's, but the mass projecting into the stomach was quadrilateral rather than conical. The reasons for why he preferred Senn's operation were these. In the first place it was extremely simple and occupied less time than either of the others; it was also probably less liable to cause leakage, and the third reason was perhaps the most important, and it was this: that it was possible to feed the patient at once, and if necessary a meal of milk or milk and egg could be introduced into the stomach on the operating table. A point of some importance in gastrostomy, he thought,

was the date at which it should be performed; undoubtedly in the earlier cases it was usually done too late, so that in many of these the patient died within a few days of the operation. During recent years, he pointed out, gastrostomy was usually performed at an earlier stage of the disease, and great differences of opinion existed among surgeons as to the best time to operate. Mr. Evans thought that a marked loss of weight was in itself quite sufficient to justify the operation, and therefore he advocated gastrostomy as soon as this loss of weight occurred, even though the patient might retain the power of still taking solid food to some extent. In an ordinary person the loss of a stone in weight was, he considered, amply sufficient to indicate operation, for this loss showed that the patient was unable to take food sufficient to keep him in health. As soon as the patient recovered from operation six ounces of milk were administered through the rubber tube, and the same quantity was given every four hours. The patient was encouraged to take food by the mouth and the teeth were kept as clean as possible; this was considered important, as tending to prevent the occurrence of sepsis in the mouth and parotid glands, for if no food was taken into the mouth the saliva was not secreted and micro-organisms readily passed up the ducts. When the patient takes solid food by the mouth he retains the pleasure of tasting and rejects what he is unable to swallow; fruit is especially useful and valuable, for though the pulp may be rejected some of the juice is certainly swallowed.

The patient soon improved in appearance and, as so often happens, his power of swallowing seemed to increase for a time. He left the hospital a fortnight after operation improved in health and spirits. The ultimate prognosis was necessarily bad, but his general condition was improved, his comfort was increased, and his death, when it occurs, will be less painful and distressing than if he had been left without surgical assistance.

TRANSACTIONS OF SOCIETIES.

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.

MEETING HELD THURSDAY, JUNE 14TH, 1906.

The President, Mr. PRIESTLY SMITH, F.R.C.S., in the Chair.

MR. NETTLESHIP and MR. MENTEITH OGILVIE gave an account, with diagrams and drawings, of a family in which twenty persons in four generations had a peculiar variety of

PARTIAL CONGENITAL STATIONARY CATARACT in the form of a perfectly circular, well defined, homogeneous or finely granular layer, of no great density, situated between nucleus and posterior pole, about 4 mm. in size. At first sight it might be taken for a small lammellar cataract, but the invariable absence of any trace of a second layer and the certainty that the opacity lay behind the nucleus negatived that diagnosis, whilst there was equally good evidence that it lay in front of the posterior pole. Some of the cases were first seen by Dr. Doyne at Oxford several years ago. These were re-examined by Mr. Ogilvie and were found to be unaltered, and he has recently discovered a large number of new cases. The change caused but little loss of visual acuity, and only a slight

desire to shade the eyes against bright light; hence the number of cases could only be determined by ophthalmoscopic examination of every accessible member of the family. Mr. Ogilvie examined about fifty persons, whilst one group living at Edinburgh was examined for the writers by Mr. G. Mackay. All the cases occurred in one branch of the family tree.

MR. SIMON SNELL (Sheffield) read a paper on **STEEL ALLOYS WHICH ARE NOT MAGNETIC.** He mentioned that during recent years steel alloys had been used in certain industries, and that these alloys had altogether different magnetic properties to ordinary iron or steel. Manganese steel which contained 12 per cent. of manganese, 87 per cent. of iron, and 1 per cent. of carbon, formed a very hard steel which was difficult to machine, but the point of interest was that it was non-magnetic. Its toughness made it useful for many purposes. Nickel and iron was another alloy, and this was as susceptible to magnetism as pure iron, but the admixture of a small percentage of manganese and carbon completely altered the magnetic properties. Thus a mixture of carbon, 0.4 per cent., nickel, 20 per cent., and manganese, 9 per cent., with iron, was absolutely non-magnetic. Another point was that if this same alloy were drenched in liquid air it became magnetic. Another alloy was chromium steel. It was magnetic

but less so than ordinary steel. Specimens of these were exhibited, and their magnetic peculiarities were demonstrated. Mr. Snell remarked that, fortunately, the vast bulk of all steel splinters penetrating an eyeball came from steel which was magnetic, and, therefore, the use of the electric-magnet was unaffected. The possibility of steel being non-magnetic should be borne in mind, and inquiries made as to the particular kind of steel from which the fragment injuring the eye became detached. In conclusion, Mr. Snell referred to other alloys which were highly magnetic. He had not, however, yet found that they were more magnetic than the soft iron in use had been.

Messrs. L. V. CARGILL and S. MAYOU described a case of

MILIARY TUBERCULOSIS

in an adult in which there was tubercle of the choroid with implication of one optic disc. The patient was a man, *æt.* 21, who was admitted into King's College Hospital in December, 1905. Although previously healthy, he had been feeling unwell for six weeks, and was supposed to be suffering from influenza. He perspired a good deal, was feverish and was losing weight. There were no physical signs in the lungs, and no tubercle was found in the expectoration nor blood. Opsonic index to tubercle was 1. Two weeks later an irregular yellowish white patch was found in the right eye near the disc, it was only slightly elevated, and there was no pigment. In the left eye there were signs of optic neuritis. The irregular pyrexia continued and signs developed in the lungs. On February 17th, tubercle bacilli were first found in the sputum, and death occurred three days later. The *post mortem* showed that the meninges were studded with tubercle, so also were the lungs and most of the abdominal viscera. The sections of the eye showed a typical tuberculous mass situated at the edge of the choroid on the outer side of the optic nerve, this mass involved the nerve and spread backwards through the lamina cribrosa. The anterior part of the globe was normal except for a congenital anterior synechia.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

SECTION OF OBSTETRICS.

MEETING HELD FRIDAY, MAY 25TH, 1906.

Sir A. V. MACAN in the Chair.

DR. ALFRED SMITH exhibited a "Specimen of Unruptured Tubal Pregnancy Removed by Operation." He said the woman, *æt.* 40, was the mother of six children, the last of whom was born last August. In January, February, and March of this year her changes were up to time, and normal. On examination, he found a mass in the left broad ligament, which he diagnosed as an ovarian cyst. Advising operation, the patient came to hospital, and after forty-eight hours he performed laparotomy. The tube seemed perfectly normal, and a little foetus was found lying in a blood clot in the cavity of the cyst as shown in the specimen.

DR. H. TWEEDY thought the hæmorrhage in this case came from the foetus. He advocated the removal of tumours at the side of the uterus for this amongst other reasons, that an unruptured tubal pregnancy might easily be mistaken for a less actively harmful tumour.

DR. HENRY JELLETT exhibited "Fibromatous Tumours of both Ovaries, with Carcinomatous Nodules throughout them, associated with Fibromyoma of the Uterus." They had been removed from a patient, *æt.* 58, who was twenty years married, and had had no children. On examination of the patient a hard, irregular tumour, filling the pelvis and extending up to the umbilicus, was found. The uterus was fixed posteriorly. He made the usual middle incision, but as this did not afford sufficient room he made a second incision, running out to the left anterior superior spine and at right angles to the first. He was then able to

remove the two ovarian tumours, which were adherent and had no pedicle. After their removal he found a third tumour formed by the body of the uterus, and consequently performed supra-vaginal hysterectomy. This case differed from a former one which he had brought before the Academy at the beginning of the Session in that there was no pre-operative infection, and that, consequently, the abdominal wound escaped infection, and also that there was not so extensive an extension of the growth. The patient was operated on on May 4, and she is now about to leave hospital apparently well.

DR. E. HASTINGS TWEEDY showed a specimen of "Intussusception in an Infant." He said the child was born in the Rotunda, and on the second day had hæmorrhage from the bowel. It died on the third day. At the *post mortem*, intussusception was discovered. He did not think that such a condition could have occurred after death. Diagnosis was impossible during the life of the child.

DR. ROWLETTE considered that the blood clot must have taken place from the point of the intussusception, and was *ante mortem*.

DR. E. HASTINGS TWEEDY read "The Report of the Rotunda Hospital for 1904-1905."

DR. ALFRED SMITH criticised the methods of estimating the standard of morbidity adopted in the British Islands, and was delighted that Dr. Tweedy had initiated a movement towards uniformity. Without accepting in full the proposed method he thought it should be given a fair trial. Considering the general instruction in Dr. Tweedy's Report that "we do not take into account the irregularities of pulse, or temperature so frequently observed within twenty-four hours of the period following delivery," some explanation was necessary as to Table IX., which included fifteen cases of morbidity occurring on the first day. He hoped this did not indicate a weak spot in their method of standardisation.

DR. H. JELLETT said that the report showed better results than previous years. He thought its form, however, might be improved, and in this connection he had brought down the report of the Clinic Baudelocque in Paris, which report, as would be seen, was divided into five distinct headings as follows:—(1) Abortions. (2) Labours. (3) Operations. (4) Morbidity. (5) Mortality. He suggested this form of report should be adopted in future. He considered that if the term "eclampsia" was to be made as wide in its meaning as Dr. Tweedy wished, it would be also necessary to widen our ideas on treatment, and not to rest content in the belief that the morphia treatment was suitable for every form of convulsion occurring in pregnant or puerperal women. Dr. Tweedy's effort to formulate a proper standard of morbidity deserved the thanks of the Academy. As to the case of the patient who died of septic infection resulting from venereal sores, he did not consider that mere abstention from examination, &c., was sufficient. Active treatment should be also adopted, and in such cases he would advise to place the patient under an anæsthetic, and treat the sores with pure formalin.

DR. STRITCH stated the procedure adopted at the Lock Hospital with puerperal cases suffering from venereal sores.

Sir ARTHUR MACAN thought the increase in the number of cases treated in the Rotunda was due to an increase in the number of external cases, which he remembered at one time only amounted to 70 per annum. It was found that the poison inducing eclampsia was lactic acid, sulphuric acid, or some other such substance. The great treatment for eclampsia was to deliver the woman. As regarded manual or operative methods of emptying the uterus in abortion, the former was preferable where possible. But where the os was tight, it was better to use the curette than to dilate the cervix. In cases of acute sepsis, it was questionable whether operative treatment was of much avail. He was not certain of the brilliant results of ligaturing the pelvic veins.

Dr. HASTINGS TWEEDY said that he would indeed be difficult to please were he not more than gratified at the very excellent reception accorded to this year's maternity report, and it was all the more gratifying to note the keen manner in which the different portions of the report were dealt with and criticised. He found himself in accord with practically all Professor Smith had said. Dr. Henry Jellett had very properly called attention to the case of one of the six women who had died, and who had been allowed to deliver herself naturally without interference, though the vulva was covered with suppurating sores. As a matter of fact, the delivery took place shortly after admission, and before active measures could be adopted. He believed with Dr. Jellett that such cases should receive very active disinfection before the birth of the child. His view as to the eclamptic statistics were that they should, at all events, be made to include the so-called uræmic convulsions, otherwise it was easy to persuade oneself that some of our fatal cases should be ascribed to this condition rather than to eclampsia. He spoke of the great work Sir Arthur Macan had accomplished during his Mastership in improving the aseptic condition of the hospital, and this in spite of the greatest structural imperfections. It was a mistake to think that Continental authorities were unanimous in the basis they adopted for estimating morbidity. As a matter of fact no such unanimity exists, and, if the maternity hospitals in the British Empire can only be persuaded to adopt the index of morbidity laid down by the British Medical Association, he believed that the good which will follow could hardly be exaggerated.

NORTH-EAST LONDON CLINICAL SOCIETY.

A Clinical Meeting of this Society was held on THURSDAY, JUNE 7th, 1906, Dr. F. J. TRESILIAN (Enfield), Vice-President, in the Chair.

The following cases and specimens were exhibited:—
Dr. TRESILIAN showed an ex-policeman, the subject of Locomotor Ataxy, whose pupils were normal. Other signs of tabes were not wanting and the condition began about three years ago.

Dr. A. J. WHITING showed (1) a woman, æt. 63, with Raynaud's Disease, the chief manifestation of which was local asphyxia. There were no cardiac symptoms. (2) A case of angio-neurotic œdema in a middle-aged man. He had attended the out-patient department of the Tottenham Hospital for some time, and various remedies had been tried with more or less success. An unusual feature in the case was that the patient knew himself when the attacks were coming on, as they were preceded by a peculiar dryness of the tongue and lips with a metallic taste in the mouth. Dr. Whiting also showed a photograph of a female patient whom he had previously exhibited before the Society, illustrating the acute phase of the disease. (3) A man with Lead Neuritis.

Dr. R. MURRAY LESLIE showed a man, an in-patient of the hospital, with aortic disease. There was no rheumatic history.

Dr. ARTHUR E. GILES exhibited (1) the appendages from a case of Double Pyosalpinx which he had removed by operation, previous to which the diagnosis had been one of tubal pregnancy. In a typical case of either kind the diagnosis was generally easy, but clinically the two conditions were often very similar. No assistance was afforded by the state of the cervix, as the cases of extra-uterine gestation generally occurred too early. A unilateral swelling was, perhaps, rather against pyosalpinx. The safest way would be to watch, if possible, for some weeks during which a tubal gestation would alter materially while a pyosalpinx would not. He thought that the history was the best guide in distinguishing an appendicitis from a pyosalpinx, the former usually having the more acute onset. (2) An ovarian tumour, partly solid, which resembled clinically a uterine myoma. In this case, moreover,

the uterus was in a state of fibrosis. (3) A uterine fibroid removed by a complete panhysterectomy.

Dr. G. BASIL PRICE showed a specimen of thrombosis of the superior and inferior longitudinal sinuses from a child, æt. 14 months, who had been admitted into the Tottenham Hospital under the care of Dr. Leslie for double pneumonia.

Dr. Leslie related the course and progress of the case since it had been under his care. At first the aspect of the child suggested a tuberculous meningitis, as it was comatose and feverish. The cerebral symptoms cleared up and then signs of pneumonia appeared. The total duration of the illness was sixteen days.

Dr. G. P. CHAPPEL recalled a similar case of a child admitted under his care for meningitis. The temperature was high, but after six days it came down and an apical pneumonia was discovered.

Dr. TRESILIAN thought that he had come across several cases of pneumonia presenting features of spinal meningitis—i.e., with tenderness over the spine, and the presence of Kernig's sign.

ULSTER MEDICAL SOCIETY.

ANNUAL MEETING, THURSDAY EVENING, JUNE 14TH.

The President, Dr. WM. ÇALWELL, in the Chair.

THE Treasurer's, Secretary's, and Librarian's reports were read and adopted. The membership has decreased slightly during the year, from the resignation of country members who joined when the institute was opened but who find it impossible to take much advantage of the facilities it affords for professional and social intercourse. On the other hand, a number of new Fellows and Members have joined, and the Treasurer's report showed that the finances of the Society were in a satisfactory state.

The following office-bearers for 1906-7 were elected:—
President: Dr. D. P. GAUSSON (Dunmurry). Vice-Presidents: Dr. W. B. McQUITTY (Belfast) and Dr. F. HOWARD SINCLAIR (Rostrevor). Hon. Treasurer: Dr. V. G. FIELDEN. Hon. Secretary: Dr. HOWARD STEVENSON. Hon. Librarian: Dr. W. L. STOREY. Hon. Editorial Secretary: Dr. J. RANKIN. Council: Sir Wm. WHITLA, Dr. J. R. DAVISON, Dr. T. A. DAVIDSON, Mr. A. FULLERTON, Dr. THOS. HOUSTON, and Dr. MCKISACK, with the seven trustees of the Institute, who are ex-officio members of Council.

On the recommendation of Council, the rule that the President should be elected for two years was altered, so that in future he shall hold office for one year, but shall be eligible for re-election.

Dr. H. H. B. CUNNINGHAM was elected a Fellow, and Drs. W. J. WILSON and A. MERRICK were elected Members of the Society.

CORRESPONDENCE.

FROM OUR SPECIAL CORRESPONDENTS
ABROAD.
FRANCE.

Paris, June 17th, 1906.

REQUISITORY AGAINST FALSE APPENDICITIS.

PROF. DIEULAFOY created a great sensation a fortnight ago at the "Académie de Médecine," by speaking against surgeons operating for appendicitis where the cases were simply those of muco-membranous typhlocolitis.

He said: "I have been struck by the number of people who have been operated on for appendicitis without sufficient reason, and unfortunately this number has not ceased to increase. I have myself been one of the most active partisans of surgical interference in the treatment of appendicitis, and the longer I live the more I am convinced that it is the only efficacious and rational treatment for removal of the infected organ before it can become mortal—a rule of simple common sense confirmed by daily experience. But when I witness the number of operations which are

performed for appendicitis when it really does not exist; when I see the number of people who by an error of diagnosis are condemned to laparotomy, I am troubled in my conscience and I consider that it is my duty to bring the question before this Academy where appendicitis has been so often the subject of loyal and courteous discussions.

Here are some facts:—

I. One day a patient came into my ward at the Hotel Dieu who had been operated on for supposed appendicitis, when in reality he was suffering from muco-membranous typhlo-colitis. The surgeon was courteous enough to send me both the patient and his appendix. The appendix was healthy. As to the patient, his malady continued its course after as before the operation.

II. I was called in consultation by a young man who had suffered for some time from muco-membranous typhlo-colitis. From time to time he experienced very painful attacks, with nausea, vomiting, and ejection of membranes and mucus. At the moment I examined the abdomen I perceived in the right iliac fossa a characteristic cicatrix. I immediately said to the patient: "You have been operated on for appendicitis?" "Yes," he replied; "for an appendicitis that I did not have; they opened the abdomen in mistake and I suffered afterwards as much as before."

III. A lady came to my consulting room at the end of last year. She described to me all the symptoms of muco-membranous typhlo-colitis, which had lasted for several years and re-occurs at intervals. I examined the patient and found in the right iliac fossa a cicatrix the nature of which I could not misunderstand. I said to this lady: "You have been operated on for appendicitis?" "Yes," said she; "I have, although I had no appendicitis and I feel just as bad as before the operation. I suffer in the same places of the abdomen and pass the same mucus and the same membranes as before. I examined the painful cæcum from which the appendix had been removed ten months before. I found the pain of typhlitis resembling that of a good number of cases of appendicitis in the right iliac fossa and I could understand the mistake of those who, neglecting the other elements of diagnosis, confounded typhlitis with appendicitis and opened the abdomen of their patient for an appendicitis which did not exist."

The following case, and one on which I particularly insist, is one of those which have contributed the most to confirm my conviction regarding the question I have brought before you. Here is the case:—

I was called in consultation to the bed-side of a young girl who had been tormented for the last two years with a muco-membranous typhlo-colitis. At times and without any appreciable reason extremely painful attacks came on, in the course of which were expelled abundant mucosities and membranes. In one of the last attacks the pain predominated in the right iliac fossa, and one of our confreres as well as a hospital surgeon pronounced the case to be one of appendicitis. In consequence an operation was proposed and readily accepted by the patient, who hoped to obtain from surgery a care that medical treatment had apparently not been able to give. In my turn I examined the patient, who had just had a violent attack. The abdomen was supple and the walls yielding. On pressure sharp pain was felt over the transverse colon and at the angle of the ascending colon, but tenderness was greater in the right iliac fossa. However, this latter fact did not appear to be sufficient to admit the case as one of appendicitis. I am not one of those who believe that appendicitis is a frequent consequence of entero-colitis, for long experience has proved to me that predominance of pain in the right iliac fossa in the course of an attack of typhlo-colitis might almost always be imputed to typhlitis and not to appendicitis. To make an appendicitis quite another clinical tableau, which did not exist in the patient I had just examined, is necessary. It is thus that in the case of this young

girl I pronounced the malady to be one of muco-membranous typhlo-colitis, with predominant typhlitis, and rejected the diagnosis of appendicitis and operation.

My confreres were of a quite opposite opinion; for them there was no doubt about the appendicitis and the operation was decided. The operator asked me very obligingly to send one of my house surgeons to bring to me the appendix after ablation. The operation was performed and the appendix brought to me at the Hotel Dieu, where I examined it carefully with the help of one of my assistants. The appendix was absolutely healthy, and histological examination proved that there was no lesion. Here also was a patient who had suffered two years from mucous membranous typhlo-colitis with predominance of typhlitis and like so many others she had been operated for an appendicitis which she did not have.

Similar mistakes have been made times without number, during these last years especially, since from different quarters the diagnosis of certain cases of *soi disant* appendicitis have been confined to an histological examination. To explain: You are called in by a patient who complains of violent pain in the abdomen; he is aware that he is suffering from muco-membranous entero-colitis, for he has had already several similar attacks; he knows also that his condition is in nowise grave, but he suffers considerably and wants relief. You examine the abdomen very carefully and methodically and find it particularly tender over the colons, and when you reach the right iliac fossa the patient cries out, for pressure in the region produces a sharper pain than anywhere else. Then if you are imbued with the regrettable doctrine that appendicitis is a frequent consequence of entero-colitis you will tell your patient that his malady is complicated with appendicitis; you will explain to him the danger, and suggest a consultation in view of an operation. Both patient and the family are in consternation. In the meanwhile the usual steps are being taken, and finally the operation is performed. But as soon as the abdomen is opened you discover your error; the appendix is healthy, the typhlitis was taken for an appendicitis, and your patient should not have been subjected to an operation, and the patient continues to suffer as before.

Such mistakes are ignored by the public, but the public begins to think that appendicitis must be an extraordinarily frequent malady judging by all the persons that are operated on. They do not know that a large number of these persons had no appendicitis; I hope that in future they will be less ignorant on the question.

As much as I am an absolute partisan of surgical interference in true appendicitis, so much am I against it in the immense majority of cases of typhlo-colitis, where appendicitis does not exist.

GERMANY.

Berlin, June 17th, 1906.

At the Medical Society, Hr. P. Kronthal read a paper on

IS HYSTERIA A NERVE DISEASE?

He was opposed to the general view that hysteria was a functional neurosis, *i.e.*, a nerve disease without a demonstrable pathologico-anatomical cause. In favour of the functional view, it had been stated that in hysteria we had to do with an abnormal reaction of cells, but neither that nor the peculiar psychological condition could be held to have any value in favour of the generally received view. The abnormal reaction must be rather looked upon as a disease of the cells than as a disease of the nervous system, and as the psyche was not to be considered simply a function of the brain, but as a sum of the reflexes, for an explanation of the psychological disturbance it was not necessary to pre-suppose a disease of the brain. The brain appeared diseased in hysteria, because the reaction of the cells was abnormal, not inversely.

Hysteria was characterised in that it was not tied

to the course of the nervous system. That was also a reason the more for the assumption that it was not a nerve disease.

Hysteria was an easily changing morbid reaction of the cells.

As regarded treatment, it followed that we must take care to strengthen the cells, and this had long been done. It was a surprising fact that we had long adopted a correct treatment empirically in spite of a false theory.

Hr. Rothmann remarked that the previous speaker could not prove his cell disease, any more than changes in the nervous system could be proved.

Hr. E. Holländer then spoke on

THE TREATMENT OF TUBERCULOSIS OF THE MUCOUS MEMBRANES.

He reported on his ten years' experience in the treatment of tuberculous diseases of the mucous surfaces. Through the knowledge of his hot air cauterisation an unusually large number of cases of tuberculosis of the upper air passages came to him. As opposed to the secondary tuberculosis after primary pulmonary phthisis, he placed before them the clinical features of primary tuberculosis for which the point of entrance had been the nose, or the mouth, and, passing over the palate, throat, and larynx passed through the lymph passages into the lungs. The disease came before us, either accompanied by lupus of the external skin or not. The pathological forms of both categories might be identical, so that with an identical etiology the distinction between lupus and tuberculosis of the mucous membranes would be lost. The speaker pointed out the, on the whole, strikingly favourable prognosis in the pronounced form of ascending tuberculosis.

Of all the therapeutical means tried the best results were obtained from the contactless action of heat. The speaker had also been successful with hot air cauterisation in a large number of other tuberculous diseases of the mucous surfaces (larynx, the eye, the rectum, joints, &c.).

As, however, surgical means were not always practicable nor always necessary, the speaker tried other chemical ones. The following he had found successful: A 5 per cent. solution of sodic iodide was given once or twice a day internally, and then calomel was applied to the diseased part. A curative action took place in ulcerative processes through an elective caustic action and the chemotatic saturation with iodine. Particularly good results were obtained in this way in tuberculosis of the bladder.

At the Surgical Society, Hr. Payr (Gratz) spoke on **IMPLANTATION OF THE THYROID GLAND INTO THE SPLEEN.**

He began his investigations three and a half years ago by experimentally implanting the thyroid into the spleen of dogs, cats, and guinea-pigs. At first only one lobe was implanted. Examination showed that the implanted lobe lived and thrived in the spleen. Four weeks later the second lobe was implanted. A number of the animals died in consequence of the second series of operations; but part survived and showed no signs of disease. Three months later splenectomy was performed on the animals. If the implanted thyroid were in active function, tetanus and cachexia must now make their appearance. As a matter of fact tetanus came on twelve hours afterwards. The hæmorrhage caused by making the pocket in the spleen, was arrested by the implantation itself, the spleen was then sutured and the omentum was fastened on over it, in order to obviate any possible hæmorrhage in the upper part of the spleen. The implanted thyroid attached itself to the splenic structure, then gradually melted away to an insignificant connective tissue structure. Thyroid in dogs diminished in size to one-seventh after the ingrafting of pieces of thyroid.

In an appropriate case he carried out the procedure in the human subject. The case was that of a child of six, with myxœdema that had been treated with

thyroid preparation for three and a half years, but with no effect. The mother gave a piece of her thyroid for the purpose, which was implanted into a pocket made in the spleen. The whole operation was finished in twelve minutes. There was no after trouble. The operation was performed on December 12th, 1905, in the Gratz Kinder Klinik. The success was great; the child began to walk, it took notice of what was going on around it, its features already displayed intelligence; it fed itself, whilst before it always had to be fed. Implantation of the thyroid into the spleen was a serious operation and one not free from danger, but in such a hopeless case it was justifiable, even if the further course of the case was not favourable.

Hr. Kocher, Berne, would not go so far as to implant the thyroid into the spleen; he had had good results from implanting it between the peritoneum and the abdominal wall, better than could be obtained by thyroid preparations. He mentioned Christiani's method, instead of implanting a large piece of thyroid, implanting smaller pieces in various parts under the skin at different times.

AUSTRIA.

Vienna, June 17th, 1906.

SCLERODERMA.

SCHULLER exhibited an interesting case of Scleroderma to the members of the Gesellschaft. The patient was a female, æt. 21, and had always been healthy up to January last year, when she got a severe chill from which she never properly recovered. Any change of temperature downwards caused the skin to become ivory white all over the body and limbs. A few months later pain commenced in the back and limbs, the skin becoming brown and hard. The body-weight began to decrease and the menses cease. In December last year she came to the Nothnagel Clinic and was treated with thyroid tabloids—five per diem. Bathing, massage and rubbing were added to the treatment, but very little progress was made.

Two months ago she was transferred to Nerve Clinic and was given two thyroid tablets per diem and ten intramuscular injections of fibrolysin. During the first period of this treatment she seemed to improve, but the hard infiltration of the skin on the face, shoulders and arms are the only parts that have yielded to the efforts bestowed on it. A freer movement of the spine, jaws, and limbs have also been observed with an increase of weight. Beyond these changes no real improvement can be affirmed.

The Röntgen rays revealed a peculiar state of the bony structure in the form of a diffuse atrophy in the spongy structure of the bone while the calcareous portion remained unchanged. It is worthy of note that Chvostek's phenomenon was prominently present in this case, *i.e.*, the motor stimuli of the facial nerve was accentuated. When the trunk of the facial nerve in front of the ear was struck the facial muscles of that side of the face were convulsed. This is a phenomenon that Chvostek found constantly present in tetany.

SPIROCHÆTA AND SYPHILIS.

Hitherto the Spirochæta pallida has been found in all the syphilitic products except the tertiary gumma and the primary lymphangitis. Ehrmann has been diligently searching for this microbe and professes to have discovered it in these organs also. Reines and Lipschutz avow that they have also found it. They all confess that a wide series of sections are necessary before the microbe can be discovered. From this testimony we infer that the germ is rare and not yet likely to convince us that this is the infecting matter in syphilis. All of these investigators, or, rather, discoverers admit that the spirochæta pallida which they have isolated is a degenerate product of the healthy spirochæta usually met with. Why this should be in the most active stage of the disease is not so easy of explanation.

TRAUMATIC ANEURYSM.

Frisch had a preparation from a patient whom he

exhibited at an earlier meeting, where the diagnosis was made and the opinion given that the aneurysm was due to arterio-sclerosis. The patient was æ t, 61, which gave credence to this opinion, but from a series of sections taken he demonstrated conclusively that arterio-sclerosis was not the cause but repeated or chronic injuries to the ulnar vessel.

ARSENIC AND IRON IN CHLOROSIS.

Winterberg has recently been dissatisfied with the pill of arsenic and iron and after several experiments in the "Krankenhaus," has come to the conclusion that the preparation called "Arsenferratose" is the most efficacious drug we possess for chlorosis. This is a modification of ferratin, agreeable in taste, causes no digestive disturbance and contains 0.3 per cent. of iron and 0.003 per cent. of arsenic. One tablespoonful can be taken daily, which is equal to 0.1 gramme of iron and 0.00135 of arsenic or 0.002 grams of arsenious acid.

In some cases the blood was at a standstill with every other form, but immediately arsenferratose was prescribed the hæmatic fluid was changed and the patient improved.

FROM OUR SPECIAL CORRESPONDENTS AT HOME. SCOTLAND.

ROYAL COMMISSION ON THE CARE AND CONTROL OF THE FEEBLE-MINDED.

This commission sat in Edinburgh on the 11th, 12th, and 13th June for the purpose of taking Scottish evidence in addition to that already tendered. After hearing various witnesses the commissioners are making a tour of inspection of various institutions in Scotland. In his evidence Dr. W. Leslie Mackenzie laid stress on the imperative necessity of systematic medical examination of elementary schools to prevent the waste of educational energy on hopeless material. In examining children in Edinburgh he found that so-called "defectives" formed one per cent. of the whole, but the scrutiny of teachers alone was insufficient to classify backward children, feeble-minded or defective, or children with undeveloped faculties. Special teaching was needed for the feeble-minded; and special classes, as well as special schools were of value, the former as a preliminary to the latter. By a fully correlated organisation of special school, industrial school, reformatory, poorhouse, and asylum, the poorhouse might be drained of some of its feeble-minded stock. In cross examination Dr. Mackenzie said that it was not enough to educate feeble-minded children and then turn them adrift. Industrial schools should be extended, and certain powers of detention were called for. He favoured special schools rather than special classes, and did not recommend that the former should be under the school board as this would clash with lunacy administration.

Mr. R. B. Barclay, General Superintendent of Poorhouses, said that at present many of the inmates of smaller poorhouses were weak-minded, and in cross-examination said that there ought to be some separation of the same from the mentally defective.

Mr. Alexander Henderson, Governor of Barnhill Poorhouse, Glasgow, gave evidence as to the class of cases admitted. Feeble-minded persons were occupied with light work, and were in many ways the most contented of the inmates.

Sir James Alexander Russell, member of the District Board of Lunacy, testified to the success of Scottish Lunacy administration, and said that any scheme for the creation of institutions for persons of unsound mind not under the supervision of the Board would be regarded by the people of the county with suspicion. Many persons who ought for their own sakes to be certified were excluded from the benefits of the lunacy laws (1) from the existence of a restricted idea as to the amount of mental unsoundness which justified certification; (2) from reluctance on the part of relatives to admit insanity; (3) and from the danger of actions

at law. In the last respect some protection should be given to those who acted in good faith.

Mr. John Gulland, M.P., said that he had been so impressed by the number of mentally defective children attending Board schools that he had introduced a Bill (now through the House of Commons) to encourage the education of Scottish epileptic and defective children by special grants, as was done in England. School boards should be responsible for the education of all children in their districts whether sound or unsound. In reply to questions Mr. Gulland advocated that special schools should be under the school board. Defective children should be placed in the same category as the blind or deaf. The duty of taking charge of them should not devolve on charity.

Dr. N. Gordon Cluckie, Greenock, said that his experience as a town and county councillor, and as an ophthalmic surgeon, convinced him that the care and control of the feeble-minded should be continued to the Lunacy Board and not intrusted to a popularly elected body.

Dr. W. W. Ireland, for many years superintendent of Larbert Institution, said that the number of imbeciles etc., in Scotland was ahead of what was generally believed. Such patients were to be educated only by special training; their health required special attention, hence institutional treatment was desirable. The great need of Scotland was a custodial asylum for adult imbeciles. Epileptics, of whom there were nearly 4,000 in Scotland, also needed help sorely. If the State were to interfere with inebriates, habitual and wasteful indulgence in alcohol should be made a criminal offence, punishable by detention until there was good prospect of reform.

Dr. Clouston's evidence was to the effect that heredity was the chief cause of feeble-mindedness; he gave the results of an investigation in regard to epilepsy and congenital mental defect in a small parish in Orkney where these diseases were more common than insanity. The brain defect was attributed to too close interbreeding over a thousand years, since the Scandinavian invasion. His suggestions for the proper meeting of the risks to society and to themselves of the existence of the feeble-minded in our population were the following:—(1) Parents should be instructed as to what the condition meant, what its risks were, and what precautions should be taken when it existed; (2) feeble-mindedness should be made notifiable; (3) the effects of such instruction and notification would be to enable parents and teachers to distinguish weak-mindedness from "laziness," "bad-temper," "vicious tendencies," &c.

Dr. John Thomson, Physician to the Sick Children's Hospital, gave evidence as to the great difficulty at present of relieving parents of the care of idiotic or imbecile children; it ought to be obligatory on parish authorities to remove suitable cases to an appropriate institution even when the parents could pay only a small amount. In the case of pauper lunatics the inspector had to answer to the lunacy commissioners if he did not have them looked after; in mentally defective cases no such obligation existed.

Dr. Urquhart, Physician to the Royal Asylum, Perth, also gave evidence that the feeble-minded and defective were not adequately provided for in Scotland, and advocated the union of Scottish districts into combination districts to provide accommodation for idiots and imbeciles. There should be one authority only—the Board of Lunacy, and the Board of Education should have nothing to do with schools for defectives.

Drs. Quin, Donald, and Cunningham gave evidence as to the need for compulsory powers in dealing with inebriates and narcomania.

Dr. J. F. Sutherland, Deputy Commissioner on Lunacy, was of opinion that the central supervision and control of all feeble-minded persons in imbecile boarding schools, poor-houses, labour colonies, etc., should be vested in the Board of Lunacy. School boards should have local supervision of feeble-minded

children of school age in attendance at special schools or classes. Feeble-minded children in reformatories, industrial schools, and training ships should be removed from those to imbecile boarding schools and later to labour colonies.

Evidence was also given by Dr. McNaughton Medical Officer of Perth Union; Sheriffs Guthrie and Fyfe, Mr. Allan, Chairman of the Glasgow School Board and Miss Montegale.

BELFAST.

PRESENTATION TO DR. DARNELL AT BANGOR.—The respect in which Dr. Darnell is held in Bangor, Co. Down, and the measure of sympathy evoked by the recent litigation in which he has been involved, were shown at a meeting held last week in the Dufferin Memorial Hall, in that town, under the presidency of Lord Clanmorris. The object of the meeting was to present to Dr. and Mrs. Darnell substantial tokens of goodwill and respect from his patients and neighbours, these taking the form of a handsome silver rose bowl, an illuminated address, and a purse of one hundred guineas. The presentations were made by the Dowager Marchioness of Dufferin and Ava, Lady Clanmorris, and Mrs. S. C. Davidson. In reply Dr. Darnell thanked his friends for their kindness and specially for the sympathy shown to him during the past two years.

It may be mentioned that the fund which is being raised by Dr. Darnell's professional brethren now amounts to about £230, with £50 more promised. It will soon be closed, and all subscriptions should be paid at an early date.

QUEEN'S COLLEGE, BELFAST.—At a meeting of the Executive Committee of the Better Equipment Fund held last week, a most satisfactory financial statement was presented. The chemical laboratories, now to be completed are to be known as the Donald Currie Laboratories. The Physiological Laboratories, for the enlargement and greatly improved fitting of which plans are ready, are to be the Jaffe Laboratories. The Pathological department is also to be better housed and equipped in the Musgrave Laboratories, while the physics professor will find a new home in the Harland Laboratories, now almost ready for occupation. The annual Parliamentary grant has never been increased since it was first voted for the upkeep of the college more than fifty years ago, so there is ample scope for the better equipment of all departments, but specially the scientific ones.

THE PRINCIPAL MEDICAL OFFICER FOR THE CITY.—The matter of the appointment of a successor to Dr. Whitaker is still much before the public and opinions are still divided as to whether the Corporation will carry out the plainly expressed wishes of the citizens, and obtain the services of a first-class man at an adequate salary, or perpetuate the job freely discussed for the past six months, when its possibility was first mentioned in our columns. The job in question is the proposed appointment of a local general practitioner, lately a member of the Corporation, but retired long enough before Dr. Whitaker's resignation to be eligible to succeed him. The public generally has not a word to say against the gentleman in question, a much esteemed practitioner, except that he has not been specially trained in public health work. It is recognised that every man has a right to do the best he can for himself, but feeling is very strong, especially so in the profession, as to the action of the chairman of the Public Health Committee, a medical man, in not giving the support to the reform party to which his medical brethren are practically unanimous in saying that party is entitled. Needless to say, if the chairman of the Public Health Committee were to say boldly that the health of the city is in a bad state, and that all the efforts of his committee have been only partially successful in improving matters, and that they must have a well qualified and thoroughly trained medical officer, the business would be settled, for no one would venture to block such a proposal coming from such a

source. But sad to admit, the chairman devotes his energies to personal remarks concerning the medical men who have appeared before the Corporation to urge the necessity for reform, and he produces elaborate statistics to prove that the health of the city is only under a temporary cloud, while week after week for months, Belfast is pilloried by the Registrar-General as having the highest, or one of the highest, death rates in the United Kingdom.

LETTERS TO THE EDITOR.

FOOD INSPECTION.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—Just now when public attention is being directed to the question of the purity of food supplies, it will probably be of interest to your readers to know something of what is being done with regard to the inspection of food sold in this country.

Some seven years ago the Report of the Royal Commission on Tuberculosis made several suggestions with a view to securing the purity of the food supply, and recommended that in future no person be permitted to act as a Meat Inspector until he has passed a qualifying examination. These suggestions and recommendations were embodied in a circular issued by the Local Government Board to the local authorities throughout the country. Following on this report the Royal Sanitary Institute, in order to facilitate the carrying out of these suggestions, established special training and examinations directed to the qualification of public officers whose particular duty was the inspection of meat and food.

These Examinations for Inspectors of Meat and other Foods are held in the principal centres in England, and have by special request been extended to colonies where other examinations are held by the institute.

The syllabus for this examination was submitted to, and in general terms approved by, the Local Government Board of England, the Local Government Board of Scotland, and the Local Government Board of Ireland. The examination is made in every way as practical as possible, and the candidates are examined on actual specimens of meat, fish, canned, and preserved foods. During the period that this examination has been held, 280 candidates have come up for examination, and 193 certificates have been granted. Many of those who have obtained certificates are now holding appointments in the principal towns and ports of the country.

The President of the Local Government Board, in reply to a question in the House last week, called attention to the importance of efficient inspection of food supplies, and it is in order to make such inspection possible that the Institute are urging the necessity of local authorities having for this purpose the assistance of competent and qualified officers.

I am, Sir, yours faithfully,

J. LANE NOTTER.

Chairman of Council.

The Royal Sanitary Institute, London.

June 14th, 1906.

ARMY MEDICAL REFORM.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—It is not likely that Mr. Brodrick's incisive and startling letter which appeared in *The Times* last week will escape your editorial eye. This letter was followed shortly by a communication from Sir Frederick Treves which deserves equal attention. It is evident that if the Army Medical Department is to be reformed the best plan will be to copy in all main details the organisation of our Japanese allies. This is almost a shameful confession, but the position will become much more shameful if things be allowed to continue as they are, for we shall then in a short time have fallen so far behind the times that our model for the first steps will be the Chinese. They, as we know, are advancing by long and steady steps in the wake of

the Japanese. If Chinese be used as a scornful term to denote grotesque topsy-turvydom in a Government institution, nothing could be more Chinese than some of the arrangements in the present administration of our Army Medical Department. What could be more grotesque than the fact that the head of the department is the Adjutant-General—an officer probably absolutely ignorant of medical science in every respect. This officer is again under the control of a Secretary of State who may not only be ignorant of medical science, but may probably be one of the large class very common, even among leading statesmen, who scorn science in general, and distrust, or hate medical science in particular. If the cry for efficiency has any real meaning we ought speedily to see a medical man put at the head of the Army Medical Department and vested with such authority and responsibility as shall do away with the defects that led to such appalling losses from disease in the South African campaign—losses which, as Sir Frederick Treves suggests, should weigh heavily on the consciences of the people of this country. They were easily preventable and could have been prevented by medical science.

I am, Sir, yours truly,
A M.D.

June 8th, 1906.

MEDICAL EDUCATION.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—I am glad to see from his letter under above heading in your issue of the 6th inst. that "Your Correspondent" has receded from his previous position. In his article of May 9th he said, speaking of medical men: "The better their knowledge of the historical teaching universities is the clearer, probably, it will appear to them that control of medical education by the profession requires not association with, but complete dissociation from, these institutions." The universities to which he refers are, it is clear, Oxford, Cambridge, and Dublin. In his letter of June 6th, however, he remarks: "I do not think that medical interests require the separation of the medical school from Trinity College." In my letter of May 16th, I tried to suggest the value of university education for medical students. "Your Correspondent" admits the argument as far as Dublin University is concerned.

With much that is contained in his letter I agree. Of the rest there is little use in speaking, since he chooses to meet my propositions, "not discursively, but by their simple contradictions."

I am, Sir, yours truly,

CRITICUS.

WORK IN LATER LIFE.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—After some years of hospital life in London we grow rather tired of it, and are glad of rest and change. We want some new fields for observation and research, where questions of interest may be assisted by those who can bring special knowledge and experience to bear upon them. During the last two years I have had opportunities of studying certain peculiar maladies or conditions which are common among those whose lives are spent in work in the slate quarries and setts in North Wales. The symptoms which come under the notice of doctors generally are rather peculiar. In a typical case the patient has been working for ten or fifteen years or more in one of the slate quarries. He complains of pain in the epigastric area, and in the back and abdomen. Sickness is sometimes troublesome. There is general debility and want of strength for work. There is apparently nothing very definite in the case, and the result is that the causes are thought to vary. Too much tea some think may be a cause, or too much whisky, though the latter is not often so. There is one symptom which is pretty constant, and that is a quick pulse, and some increase and irregularity of the action of the heart. A pulse varying from 96 to 120 is usual. Irregularity of the bowels and constipation is another symptom. Pains in the

lower dorsal region and down the thighs are usual. On inquiring carefully into the history of these cases, the conclusion we are forced to come to is that the peculiar work of quarry and sett men, for many hours a day, and for many years, then the strain from use of heavy hammers and the position of the body are also peculiar, causes cardiac dilatation and its consequences; and these cases are interesting, for we do not meet with them in our City hospital experience. It is impossible to avoid reflection on the lives of men who are fine samples of muscularity and health, but whose work is attended with consequences which are sad and distressing, and which should in some way be considered by us, as a question of fair and honest conduct.

I am, Sir, yours truly,

T.

ISOLATION HOSPITALS AND SCARLET FEVER CASES.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—I should be glad to add my testimony to that of Dr. Ross, who writes in THE MEDICAL PRESS AND CIRCULAR of June 13th. In the borough in which I reside, a semi-rural albeit "urban" district, there existed ten years ago no isolation accommodation of any kind for infectious diseases. The housing problem was chronic; much overcrowding existed permanently among the poor, and every year outbreaks of disease occurred even among the scattered and isolated village colonies comprised within the district where the natural surroundings are of the most favourable character. Scarlet fever attended by a considerable mortality was a frequent visitor; and the severe sequelæ mentioned by Dr. G. J. Ross, as so commonly following badly attended cases were noticeable in many instances. The sanitary administration of the whole district was in a backward condition; and with a view to improvement a ratepayers' association was formed—the Town Council, composed almost completely of small local tradesmen, showing no inclination to initiate reform. They were soon forced to open a temporary hospital for scarlet fever; and, later, to build and equip a complete isolation hospital in accordance with the requirements of the Local Government Board. The immediate result was practically to put an end to the deaths from scarlet fever, and to prevent the disease from occurring more than sporadically. During ten years there has been no wide-spread outbreak amounting to a small epidemic such as before used to occur frequently. Every one of the advantages named by Dr. Ross has been conspicuous. One advantage he does not refer to. A single scarlet fever case in a home very often means stoppage of work for every inmate engaged in wage-earning; it often means poverty and misery, or at least considerable money loss. All this is now put an end to by prompt removal of the cases and thorough disinfection of the house. The cost of the hospital and the charge on the rates for its upkeep are repaid over and over again in the benefits conferred upon the whole community.

I am, Sir, yours truly,

Reigate, June 13th, 1906.

A RESIDENT.

OBITUARY.

SIR HALLIDAY MACARTNEY, K.C.M.G., M.D.

SIR HALLIDAY MACARTNEY, for nearly thirty years British Secretary to the Chinese Legation in London, died on June 8th. He was born at Galloway in 1833, and studied medicine at the University of Edinburgh, where he took the M.D. in 1858. While a student he served with the medical staff of the Anglo-Turkish contingent in the Crimea. He was attached to the 99th Regiment, with which he went to India, and afterward to China, where he found his destiny. After the sack of the Summer Palace and the proclamation of peace, he obtained permission to enter the Chinese service. He took an active part in the Taiping rebellion. He founded an arsenal at Nanking and after

wards entered the Diplomatic Service. Later Macartney organised the diplomatic representation of China in Europe, remaining in London as Councillor to the Chinese Embassy. He was created K.C.M.G. in 1885. Sir Halliday Macartney first married a Chinese lady; in 1884 he married a French lady, and in 1902 was left a widower with three sons and one daughter.

JAMES MOWAT, M.B., C.M., Edin.

We regret to report the death, at Edinburgh, on May 25th, at the age of 43, of Dr. James Mowat. Dr. Mowat was educated medically in the University of Edinburgh where he graduated C.M. in 1887. He was Surgeon-Captain to the 9th Volunteer Brigade (Highland Brigade) Royal Scots, and Surgeon to the High Constables of Edinburgh.

SPECIAL ARTICLES.

THE OPENING OF THE KING'S SANATORIUM AT MIDHURST.

THE opening of the great sanatorium for consumption at Midhurst, Sussex, forms a notable landmark of modern preventive medicine. Among all his solid claims to a lasting place in the pages of history, it may well be that His Majesty King Edward VII. will leave behind him none more lasting than that institution formally opened on June 13th. Accompanied by the Queen, His Majesty was received at Midhurst Station, which lies about seven miles from Haslemere, by the Lord Lieutenant of the County, the Duke of Norfolk, the Sheriff, and other officials and neighbouring notabilities, together with the Advisory Committee, including Sir William Broadbent, Sir Francis Laking, Sir Douglas Powell, Sir Felix Semon, Sir Frederick Treves, Sir Hermann Weber, Dr. Theodore Williams, and others. Dr. Arthur C. Latham and Dr. F. J. Wethered, who had gained respectively the first and second prizes for essays on the constitution of sanatoria, were presented to the King. The building stands some 500 feet above the sea level, in the midst of its own grounds covering upwards of 150 acres of land more or less surrounded by pine forest. The sanatorium is built almost on the centre of the site, and is divided into two portions, one for patients and the other for administrative purposes. The building is of red brick and white stone, and is distinguished by its red roof, its green shutters, and its broad balconies for patients. The interior is fitted up according to modern views, with washable and polished surfaces, good ventilators, and specially constructed furniture. The sanitary fittings by Messrs. Doulton are specially to be noted as representing the best and most advanced productions of modern sanitary science. The accompanying illustration shows a hydro-therapeutic room fitted up by that firm. There is accommodation in the King's Sanatorium for 100 patients, of whom 14 will pay eight guineas a week, and the remainder two guineas weekly, while accommodation is provided for 22 necessitous patients. The class for whom the Sanatorium is intended is the class just above the very poor, upon whom the stress of a chronic disabling disease such as tuberculosis falls with such disastrous weight. Medical men will learn a great deal by a visit to Midhurst Sanatorium.

TREATMENT OF VENEREAL DISEASE IN THE ARMY.

THE Advisory Board for Army Medical Services has issued a "Final Report" on the above subject. It will be remembered that three previous reports have been drawn up regarding the same subject, of which the first dealt with current medical literature, and with information in the possession of the Army Medical Department; the second contained the opinions of physicians and surgeons as experts; while the third was the account of a tour undertaken by Major Pollock, R.A.M.C., to collect information on the subject at various foreign centres. The intention of the present document is to present the principal conclusions to be drawn from the information previously collected, together with practical recommendations as to treatment. In this intention there is no doubt that it succeeds admirably; and while there is no new information to be found in its pages, it will be found a convenient and, within limits, a trustworthy guide for those who have to treat syphilis, particularly under the conditions of military life.

The subject of the prevention of venereal disease

does not enter into the terms of reference to the committee responsible for the Report, but, nevertheless, a section is devoted to establishing the proposition that "taking into consideration the present state of expert opinion abroad, and the opposition certain to be raised in this country should the re-enactment

(a) "The Treatment of Venereal Disease and Scabies in the Army." Final Report. London: Printed for His Majesty's Stationery Office by Eyre and Spottiswoode. Price 6d.

of a statute on the lines of the Contagious Diseases Acts be proposed, the Committee has come to the conclusion that in the United Kingdom, at any rate, an attempt to grapple with the problem of venereal disease by methods of compulsory isolation and treatment is neither practicable nor expedient."

As the question discussed was avowedly outside the immediate work of the Committee, it might have been better to refrain from any expression of opinion on the point.

There follows a full discussion of the mercurial treatment of syphilis, starting with the established fact that experience is unanimously in favour of the mercurial treatment. Considerable stress is laid on the supposed necessity of thoroughly establishing the diagnosis before starting treatment:—"It is agreed, by nearly all that the presence of syphilis must be absolutely ascertained before this drug is administered. The amount of evidence, however, required by different individuals in order to establish the diagnosis appears to vary within considerable limits." Some, in fact, believe they can distinguish syphilis by the primary sore, while others demand that secondary symptoms must have developed.

"It appears to the Committee that accuracy in diagnosis is essential to thorough treatment, and in such a matter the judgment of the medical adviser must be guided by his own experience, and by the special condition of the patient. It is, strongly felt, however, that in all cases of doubtful infection the patient should be kept under close and if necessary, prolonged observation, and that before mercury is administered, the presence of syphilis should be established without doubt. The risk incurred by delay in the administration of mercury is inconsiderable compared to the importance of a correct diagnosis."

It hardly seems to us quite established that in order to have perfectly trustworthy statistics, the health of individuals and, therefore, the efficiency of the Army as a whole is to be endangered. The first function of the medical department of the Army is to safeguard the health of the individual men, and not to compile accurate statistics, however great may be the scientific value of the latter.

The Report gives clear and thorough instructions regarding the administration of mercury, whether by the mouth, by the skin, or by injection. There is a distinct leaning toward the last method, which, as regards military practice, is certainly the most trustworthy. With ordinary aseptic precautions it appears free from risk.

Sound practical advice is given regarding the treatment of gonorrhoea, soft chancres, buboes, and scabies.

The question is discussed as to whether venereal diseases should be treated in special hospitals or not, and the opinion arrived at that the best method is to treat such diseases in specially arranged wards of general hospitals.

The Report will be found of great practical value to military and naval surgeons, and will well repay perusal by all who may have to treat venereal diseases in general practice.

REVIEWS OF BOOKS.

THREE NEW WORKS ON OPERATIVE TECHNIQUE.

DR. YELVERTON PEARSON (1) in the course of a most interesting work on Modern Surgical Technique, deals at some length with the principles and technical details required by modern surgery. The book is primarily intended for students, house-surgeons, and surgical assistants, but the author also hopes, and we

(1) "Modern Surgical Technique in Its Relation to Operations and Wound Treatment." By C. Yelverton Pearson, M.D., M.Ch., F.R.C.S., Professor of Surgery, Queen's College, Cork; Fellow and Examiner in Surgery, Royal University of Ireland; Surgeon to the North Cork Infirmary; c. &c. Pp. xix. and 392. With two coloured plates and 111 illustrations in the text. London: John Bale, Sons, and Danielsson. 1906.

think his hope will be realised, that it will be found of use to the operating surgeon and the general practitioner.

The book is divided into four parts. The first is entitled "Preliminary Considerations," and deals with such subjects as the principles of aseptic surgery, surgical bacteriology, infection, disinfection, and antiseptics. Part II. deals with prophylactic disinfection, and contains twelve chapters in which the disinfection of the hands, the use of gloves, the preparation of the patient's skin and mucous membrane, the sterilisation of instruments, and the preparation of sponges, suture materials, &c., are fully discussed. The chapter on the infection of the hands is particularly full, and in addition to containing a careful description of many of the different methods of sterilising the hands, contains an interesting account of actual bacteriological experiments on hands made by Professor Pearson and his assistants. The methods recommended certainly do not err on the side of laxity, and we confess that it is with a thankful spirit that we recognise what the ability to operate in gloves saves one. We do not mean to convey that Dr. Pearson fails to attach due importance to gloves, but we think that perhaps he needlessly emphasises the undoubted difficulties to which they at first give rise. No one can operate with comfort in gloves at the first attempt, nor at the second nor third, any more than one can at first walk with comfort in snow shoes. Constant practice however, breeds confidence in their use, and once the surgeon has got thoroughly accustomed to them he will find that it is in but few cases that he will be inclined to voluntarily discard them.

Part III. deals with wound technique—the nature and treatment of wounds, the prevention of hæmorrhage, needles, sutures, and drainage material and their uses. With regard to the all-important question of drainage, the author is inclined to the advice of Senn, "When in doubt, drain," particularly in the case of emergency operations. Part IV. deals with operative technique, post-operative treatment, operations in private houses, and asepsis in general practice. It is carefully written and contains much information of value.

Dr. Pearson puts what he has to say clearly and succinctly. His book is full of information, and is most valuable as a reference on small points, and its teaching is modern and surgically correct in all particulars. We are confident that in recommending the book to surgeons generally, our advice will be appreciated by those who take it.

MR. C. HERON WATSON (2) has accomplished a work of much value to those members of the medical profession who do not read German with facility by bringing forward a translation of Carl Haegler's work on the Cleansing, Disinfection, and Protection of the Hands. This most valuable monograph deals at considerable length with the subject of hand sterilisation and protection, and constitutes perhaps the most important work existing on the subject. Its general trend may be summed up in the author's words:—"We possess neither chemical nor mechanical means enabling us to rely with certainty on the practicability of always rendering the hands absolutely free from germs, either for the space of a moment or for a period of time requisite for the performance of an operation. In view of this, the expression "sterilisation of the hands," is meaningless. The logical outcome of such experience would seem to us to be the recommendation of the universal use of rubber gloves. Professor Haegler however, does not come to such a conclusion. Again, to quote him:—"As a rule, when operating, I wear sterile thread gloves, and these I subsequently change several times. I am well aware that these gloves are permeable; but, on the one hand, they prevent the

(2) "The Cleansing, Disinfection, and Protection of the Hands: an Experimental and Critical Study." By Dr. Carl B. Haegler. Translated by Charles Heron Watson, M.B., F.R.C.S.Ed., Assistant Surgeon to the Leith Hospital. Pp. xix. and 218. With nine full-page illustrations. Edinburgh and London: William Green and Sons. 1905

surface of the hands from coming in direct contact with the wound or the ligatures, and, on the other hand, they permit of smooth organs—such as loops of intestine—being handled with much greater certainty. Still, I do not shrink from introducing my bare hand into the abdominal cavity in prolonged investigation of its contents, or in other manipulations. In the case of all operations on inflamed tissues, I wear rubber gloves." We strongly recommend the perusal of this work to all those interested in the important subject of skin sterilisation.

DR. RUSSELL FOWLER'S (3) work on the "Operating Room and the Patient," contains about a quarter the amount of writing that Professor Hægler's work contains, but in true American fashion it is spread out so as to occupy a book of some twice the size and weight. The book is dedicated to nurses and and intern students and is in large measure intended for them. Had it been produced in a less pretentious form we should more willingly notice with favour its many good points, but when the material for a student's booklet or manual is laid before its readers as in this book, it must naturally expect to be subjected to a more severe criticism than its relative importance seems to justify. The spelling is very dreadful and is not even consistent. If we must spell "iodin" and "benzin" thus, why should "sterile" and "vaseline" be allowed to save their tails? We note that rubber gloves after disinfection are to be hung up to dry, and their surfaces kept from coming into contact by "blowing into the glove occasionally or by packing the fingers with strips of iodoform gauze." These, of course, are undoubtedly two ways of effecting the desired end, but "there are others." The last forty pages of the book are occupied by lists of instruments required for different operations. These lists will no doubt be useful to nurses, but we confess we do not see the necessity of devoting forty pages of superfine paper to them. They might equally well have been disposed of in ten pages. There are some twenty photographs of patients in different attitudes and in different degrees of undress, in addition to fifteen other illustrations.

THE DENTISTS' REGISTER, 1906. (a)

THE Dentists' Register for 1906 contains the usual information as to registration, fees upon registration, the Dental Act in full, and other important matters connected with the dental profession generally. The important notice to registered dentists which first appeared in the issue of 1904, again is prominently displayed on page 3, and it behoves all registered practitioners to see to it that their names are duly included in the list at the end of the book. It is interesting to note that the number of practitioners who were registered under the Act of 1878 as being before that date in *bona fide* practice of dentistry, is gradually though slowly shrinking, the percentage being 16 per cent., as against 18 per cent. in 1903 of the whole number of registered dentists.

THE DENTAL ANNUAL, 1906. (b)

THIS excellent work (now in its fourth year of issue) contains references, arranged with clearness and simplicity, to practically all the recent work and events connected with or touching on dental matters generally. The new educational regulations at home and in the colonies, recent professional organisations, proceedings of the General Medical Council, and many other important matters, are included in its pages. One of the features of the book is a "Directory of Dental

Practitioners," arranged topographically; while the long list of distinguished names of contributors on Pp. XX-XXI, is a guarantee of the catholicity of the special articles. It would be beyond the space at our disposal to enumerate all the many articles on novelties or improvements of the past year, but among those which we have noted specially may be mentioned those on Aluminium and its Uses in Dentistry, Anæsthetics (illustrated), and Obtundents, typical subjects which will interest all practitioners who wish to keep their knowledge of scientific progress abreast of the times. There can be no doubt that the "Dental Annual" is a reference work of the highest value, which no dentist can afford to be without.

BUCHANAN'S HANDBOOK OF SURGERY. (a)

WE have perused this very readable manual with very great pleasure and profit. It is a handbook in every sense of the word, and gives very concise and practical information on general surgery and should prove useful to those students who have learnt their surgery from many authors and teachers. To those who are about to present themselves for examination in surgery, this book ought to be of great assistance, as all subjects are carefully treated and brought well up-to-date. We have no hesitation in recommending its perusal to teachers in surgery, and advanced students preparing for examination. The subjects are divided into three sections running into twenty-three chapters, and the volume is not large, but convenient in size, and easily carried to class-room or medical school.

THE HEALTH OF OUR CHILDREN. (b)

THIS book is an attempt on the author's part to pass on some of her experiences gained in Africa and in India to mothers whose lot it may be to bear and rear their children in sub-tropical climates. The pages are full of useful and practical information regarding the ordinary ailments of infancy and childhood. After two valuable chapters on growth and development we have an account given of infant-feeding. Miss Robinson is clear and dogmatic on the question of breast-feeding, which she says must not be given up until strict investigations have been made of the case by a medical man. In speaking of the results of feeding babies on condensed milk, we notice she refers to an authority who, however, has been called by the name of Hutchenson! (Should this not be Hutchinson?) The following chapter on "Dentition," is from the pen of Mr. W. S. Marsh, and is not only short, but very much to the point. The most interesting chapter in the whole book, however, is that on "Mental Development and Early Training." The causes of backwardness are stated to be ill-health, chronic dyspepsia, rickets, and mental defects, and the management of such cases is very clearly pointed out. The section on the subject of nursing discipline is full of important hints which, if acted on, will do much to prevent children from growing up spoilt and unmanageable. The rest of the book is concerned with the diseases incident to children. A chapter on "Nursing Emergencies" is given, and includes within its purview the management of fits, burns, cuts, bites and stings, foreign bodies, earache and toothache. A number of useful formulæ are given as an appendix.

This is altogether a sensible volume, free from much of the semi-scientific language which, unfortunately, too often abounds in such popular handbooks. It is written for intelligent people by one who knows what she is talking about and who has her theme at heart.

(3) "The Operating Room and the Patient." By Russell S. Fowler, M.D., Surgeon to the German Hospital, New York. Pp. 172. Illustrated. Philadelphia and London: W. B. Saunders Company, 1906.

(a) "The Dentists' Register, 1906." Printed and published under the direction of the General Council of Medical Education and Registration of the United Kingdom.

(b) "The Dental Annual and Directory, 1906." London: Baillière, Tindall and Cox, 1906. Price 7s. 6d.

(a) "Handbook of Surgery." By George Burnside Buchanan, B.A. Cantab., M.B., C.M., F.F.P.S. Glasg., Assistant-Surgeon, Western Infirmary, Glasgow; Assistant-Surgeon, Cancer Hospital, Glasgow. Sections III., Chap. xiii., pp. 525. 6s. net. Edinburgh: John Currie, 1906.

(b) "The Health of our Children in the Colonies. A Book for Mothers." By Dr. Lilian Austin Robinson. London: Longmans, Green & Co., 1906. Price 2s. 6d. net.

The book may be recommended as a guide not only to mothers in the Colonies, but even to students and general practitioners at home who desire to have an elementary knowledge of children and their diseases. We note that there is no index, and this defect should be remedied should a second edition be called for.

NEW BOOKS AND NEW EDITIONS.

The following have been received since the publication of last list:—

- BAILLIÈRE, TINDALL AND COX (London).**
A Manual of Medicine. By Thomas Kirkpatrick Monro, M.A., M.D. Second Edition. Illustrated. Pp. 1,023. Price 15s. net.
- The Nature and Treatment of Cancer (Some Methods of Hypodermic Medication in the Treatment of Inoperable Cancer).** By John A. Shaw-Mackenzie, M.D., Lond. Third Edition. Revised and Enlarged. Pp. 99. Price, 2s. 6d. net.
- Gastric Surgery: Being the Hunterian Lectures delivered before the Royal College of Surgeons of England, on Feb. 19, 21, and 23, 1906.** By Herbert J. Paterson, M.A., M.B., etc., etc. Illustrated. Pp. 181. Price 5s. net.
- Supplementary Essays on the Cause and Prevention of Dental Caries.** By J. Sim Wallace, M.D., D.Sc., L.D.S. Pp. 31. Price 2s. 6d. net.
- The Ship-Surgeon's Handbook.** By A. Vavasour Elder, M.R.C.S., L.R.C.P., Surgeon Orient Steam Navigation Company. Pp. 167. Price 3s. 6d. net.
- Manual of Anatomy, Systematic and Practical, including Embryology.** By A. M. Buchanan, M.A., M.D., etc., etc. Vol. I.: Osteology; upper limb; lower limb. With 268 illustrations, mostly original and in colours. Pp. 569. Price 12s. 6d. net.
- Phlebitis and Thrombosis: The Hunterian Lectures, 1906.** By Warrington Haward, F.R.C.S. (Eng.) Pp. 88. With eight plates. Price 6s.
- Lectures on Midwifery for Midwives.** By A. B. Calder, M.B., M.R.C.S., Lecturer on Midwifery to London County Council. Illustrated. Pp. 274. Price 6s. net.
- J. B. BAILLIÈRE ET FILS (Paris).**
Traité d'Hygiène. Vol. II. Le Sol et L'Eau, sous la direction de M.M. P. Brouardel and E. Mosny. Pp. 460.
- JOHN BALF, SONS, AND DANIELSON, LTD. (London).**
The Urethrotomy and Kidney Capsulotomy in Diseases and Injuries of the Urinary Organs. By Reginald Harrison, F.R.C.S. Pp. 96. Price 2s. 6d. net.
- CASSELL AND CO., LTD. (London).**
A Handbook for Midwives and Maternity Nurses. By Comyns Berkeley, B.A., M.B., B.C. Cantab., M.R.C.P. Lond., M.R.C.S. Eng. Pp. 283. Price 6s.
- J. and A. CHURCHILL (London).**
Preservatives in Food and Food Examination. By John C. Thresh, M.D. Vict., D.Sc. London., F.I.C., and Arthur E. Porter, M.D. M.A. Cantab. Pp. 484. Price 14s. net.
- JOHN CURRIE (Edinburgh).**
Handbook of Surgery. By George Burnside Buchanan, B.A. Cantab., M.B., etc., etc. Pp. 647. Price 9s. net.
- WM. GREEN AND SONS (Edinburgh and London).**
Green's Encyclopedia and Dictionary of Medicine and Surgery. Vol. I.: Aachen to Brain. Pp. 538.
- Notes on Local Anæsthesia in General Surgery.** By J. W. Struthers, M.B., F.R.C.S. Eng. Pp. 136. Price 2s. 6d. net.
- T. C. AND E. C. JACK (Edinburgh).**
The Edinburgh Stereoscopic Atlas of Anatomy. Edited by David Waterston, M.A., M.D., etc. Section 5: Containing 50 Stereographs. Price 25s. net.
- H. K. LEWIS (London).**
Catarrhal Fevers, commonly called Colds; Their Causes, Consequences, Control, and Cure. By R. Prosser White, M.D. Ed., M.R.C.S. Eng. Pp. 111. Price 4s.
- Clinical Bacteriology and Hæmatology for Practitioners.** By W. D'Este Emery, M.D., B.Sc. Lond. Being the second edition of "A Handbook of Bacteriological Diagnosis for Practitioners." Pp. 240. Price 7s. 6d. net.
- The Combined Treatment in Diseases of the Eye.** By G. Herbert Burnham, M.D. Tor., F.R.C.S. Edin., M.R.C.S. Eng. Pp. 82. Price 3s.
- The Public Health Acts and Other Sanitary Laws and Regulations.** Specially prepared for the Diploma of Public Health. By Martin Elliott, of the Middle Temple and Western Circuit, Barrister-at-Law; and Gilbert Elliott, M.R.C.S.E., L.R.C.P., D.P.H. Lond., D.T.M. Cam. Pp. 168. Price 5s. net.
- J. B. LIPPINCOTT CO. (London).**
International Clinics. Edited by A. O. J. Kelly, A.M., M.D. Vol. I. Sixteenth Series, 1906. Pp. 308. Price (4 vols.) 35s. net.
- LONGMANS, GREEN AND CO. (London).**
The Diseases of the Nose and Its Accessory Sinuses. By H. Lambert Lusk, M.D. Lond., F.R.C.S. Illustrated. Pp. 399. Price 25s.
- MACMILLAN AND CO., LTD. (London).**
Appendicitis: Its Pathology and Surgery. By C. B. Lockwood, F.R.C.S. Second Edition. Pp. 342. Price 10s. net.
- A System of Gynecology by Many Writers.** Edited by Thomas Clifford Allbutt, M.A., M.D., etc.; W. S. Playfair, M.D., LL.D., etc.; and Thomas Watts Eden, M.D. Edin., F.R.C.P. Lond. Illustrated. Pp. 949. Price 25s. net.
- The Obstetrical Society of London: Transactions of the Obstetrical Society of London.** Vol. XLVIII. for the year 1906. Part I. for January and February. Edited by Herbert R. Spencer, M.D., and Robert Boxall, M.D. Pp. 68. Price 4s.

- YOUNE J. FENTLAND (Edinburgh).**
Text-Book of Anatomy. Edited by D. J. Cunningham, F.R.S., M.D., etc. Second Edition. Revised and Illustrated. Pp. 1,388. Price 31s. 6d. net.
- W. B. SAUNDERS AND CO. (London).**
A Treatise on Surgery. By George Ryerson Fowler, M.D. Illustrated. Pp. 722. 2 vols. Price £3 3s. net.
- A Treatise on Diagnostic Methods of Examination.** By Prof. Dr. Hermann Sahli. Edited (with additions) by Francis P. Kinnicutt, M.D., and N. B. Potter, M.D. Illustrated. Pp. 1,008. Price 27s. 6d. net.
- Nursing in the Acute Infectious Fevers.** By George P. Paul, M.D. Illustrated. Pp. 200. Price 4s. net.
- Essentials of Genito-Urinary and Venereal Diseases.** By Staling S. Wilcox, M.D. Illustrated. Pp. 313. Price 4s. net.
- THE SCIENTIFIC PRESS, LTD. (London).**
The Consumptive Working Man: What Can Sanatoria do for Him? By Noel Dean Bardswell, M.D., M.R.C.P., F.R.S. Pp. 202. Price 10s. 6d. net.

Fibroid Tumour: A New Treatment Without Operation. By John Shaw, M.D. Lond. Pp. 80. Price 2s. 6d. net.
- JOHN WRIGHT AND CO. (Bristol).**
Consumption: Treatment at Home and Rules for Living. By H. Warren Crowe, M.D. Pp. 32. Price 1s. net.
- Diabetes Mellitus: its Pathological Chemistry and Treatment; Being Part VII of several Clinical Treatises on the Pathology and Therapy of Disorders of Metabolism and Nutrition.** By Prof. Dr. Carl von Noorden. Pp. 211. Price 5s. net.

NEW PREPARATIONS.

TABLOIDS, MISTURA ALBA.

The latest form of tabloid issued by the well-known firm of Messrs. Burroughs and Wellcome is that of a compound magnesium laxative. The precise combination is 15 grains of magnesium sulphate, 2½ grains of magnesium carbonate, and 130 minim of oil of peppermint. The directions are to crush the tabloid and dissolve in water, varying the number of tabloids in proportion to the dose required. This certainly seems a practical pharmaceutical product likely to be of use to busy practitioners, and especially as the source of origin is an absolute guarantee of the purity of the drugs employed.

BOROFAX.

"BOROFAX" is an antiseptic soothing emollient, possessing sedative properties. It is said to be superior to ointment or glycerin of boric acid in therapeutic action, owing to its readiness of absorption, its pharmaceutical elegance, and its freedom from rancidity. It encourages healing of superficial lesions,

and, therefore, forms a good application for chaps, burns, scalds, and abrasions. "Borofax" may be used with advantage in the treatment of eczema and many other skin affections, and also in excoriation or disease of mucous surfaces, such as that of the nostrils. It is beneficial and soothing to the skin after driving, motoring, cycling or exposure to extremes of temperature, and is supplied in collapsible tubes of two sizes.

OPHTHALMIC CAPSULES (DUNCAN).

DUNCAN'S Ophthalmic Capsules are intended to meet the requirements of the ophthalmic surgeon, who frequently requires to prescribe a short treatment of an ointment. These capsules, after being filled with an ointment, are hermetically sealed. They have a long tapering neck, and in using them all that is necessary is to snip off the extreme end with scissors and to give a gentle pressure, when the ointment will at once exude. These capsules also keep the ointment in an aseptic condition, as no more than the quantity necessary for use becomes exposed to the air. The gelatine has no action upon the ointment. This is a great advantage over the use of the metallic collapsible tubes, which are very apt to deteriorate the ointment. These capsules may be filled with any ointment which may be required; they are kept in stock made with cocain, atropin, and yellow oxide of mercury.

MEDICAL NEWS IN BRIEF.

Royal College of Surgeons of England.

AN Ordinary Meeting of the Council was held at the College on Thursday last, Mr. John Tweedy, President, in the Chair. The following members of the College having passed the required examinations and conformed to the bye-laws were admitted Fellows of the College: Edward Victor Hugo, M.D.Lond., and St. Barts; William G. Mortimer, M.B.Lond.; William P. Noall M.B.Lond., Manch. and Lond.; George I. T. Stewart, M.B.Aberd. and St. Thomas'; Arthur F. Hayden, M.B.Lond., and St. Mary's; Harold E. Ridewood, M.D. Lond.; Ernest Ward, M.B.Camb. and Lond.; Alexander M. Webber, M.B.Lond., and Guy's; Percival P. Cole, L.R.C.P.Lond., Guy's; George R. Footner, M.B.Camb. and St. Thomas'; William M. Mollison, L.R.C.P.Lond., Guy's; William J. O. Malloch, M.B.Toronto and Lond.; James A. Coupland, M.B.Lond., and Leeds School; Vivian B. Bennett, M.B.Lond., St. Thomas' and St. Bart's; George G. Farquhar, M.B.Aberd.; Duncan C. L. FitzWilliams, M.D.Edin.

Diplomas in Dental Surgery were granted to the following candidates:—Oswald H. Anderson, James E. O. Brawn, Charles S. Brown, Hugh G. Clark, Horace G. Codner, George W. Collinson, Wilfrid J. P. Dicks, Sidney G. Elliott, Walter Elwood, Roland P. Fenn, William E. Freeman, Cecil C. Freer, Francis J. Gillett, Joseph C. Harris, Oliver W. Heald, John W. Hindle, Frank M. Holborn, William J. Jones, Charles G. Lewis, Hugh W. Mace, Horace E. Marsh, Joseph W. Meadows, George K. B. Neal, William C. Palk, John H. Parsonage, Edward S. Pierrepont, Arthur T. Pitts, Horatio L. Power, William H. Plowman, Walter Rose, Harold Simms, Frederick Smith, Albert Spray, Greenwood Stansfield, Thomas C. Stephen, Cyprian H. Taylor, Ernest Wright.

QUESTION OF ADMITTING WOMEN TO THE COLLEGE EXAMINATIONS.

A report was received from a Committee appointed to consider the question of admitting women to the examinations of the College. The committee referred to the following resolution adopted by the Council in 1895: "That the Council of the Royal College of Surgeons of England, although in favour of granting the petition of the officers and teachers of the London School of Medicine for Women, do not see their way to admit women to the conjoint examinations in face of the vote of the meeting of Fellows and Members of this college and the expressed opinion of the Royal College of Physicians." The committee expressed the opinion that the time had come for again affording the Fellows and Members an opportunity of expressing an opinion in the matter, and they recommended that the Fellows and Members be consulted as to the desirability of approaching the Royal College of Physicians on the subject. The Council adopted the recommendation of the Committee.

The following examiners were elected for the ensuing year:—Board of Examiners in Anatomy and Physiology for the Fellowship: Anatomy, Mr. L. A. Dunn, Dr. Arthur Keith, Dr. Christopher Addison, and Mr. W. McAdam Eccles; Physiology, Professor E. Waymouth Reid, F.R.S., Professor E. H. Starling, F.R.S., Professor Leonard Hill, F.R.S., and Professor de Burgh Birch, M.D. Conjoint Examining Board: Elementary Biology, Dr. T. G. Stevens and Dr. H. W. Marett Tims; Anatomy, Mr. H. J. Waring, Dr. Arthur Keith, Dr. Christopher Addison, and Mr. J. Ernest Lane; Physiology, Professor W. H. Thompson, M.D., Dr. T. G. Brodie, and Mr. J. B. Leathes. Midwifery, Dr. G. F. Blacker, Dr. Arthur H. N. Lewers, Dr. W. Rivers Pollock, and Dr. Walter W. H. Tate. Public Health: (Part I.), Dr. Harold Spitta; (Part II.), Dr. H. Timbrell Bulstrode.

A summary of the history of the college, prepared by the President and Secretary, was presented, and it was decided to publish it in future editions of the College calendar.

A letter was received from Mr. Henry Morris reporting the proceedings of the General Medical Council at their recent Session, and a vote of thanks was given to him for his services as the representative of the College in that Council.

Royal University of Ireland.

THE Royal Warrant appointing Lord Castletown, of Upper Ossory, to be Chancellor of the Royal University of Ireland in the room of the Earl of Meath, resigned, has been received at the University. Important alterations have been made both in the Arts and Medical curriculum for the coming year. In future, instead of exhibitions of £40 and £25 respectively being awarded to the first and second candidates at the final examination on the marks received by them in all subjects, three exhibitions of £25 each will be given in special branches. One of these will be given to the best candidate in medicine, one in surgery, and one in gynaecology and midwifery. This is a much needed reform and one which we believe will be received with approval by the Examining Board.

Distribution of Liege Exhibition Awards.

THE Awards of the British Section of the recent Liege Exhibition were distributed on June 13th. The proceedings took place at the Mansion House, and the Lord Mayor, Alderman W. Vaughan Morgan, occupied the chair. Mr. Imre Kiralfy, the British Commissioner-General, read a report upon the Exhibition, and the meeting was subsequently addressed by the Belgian Minister, Count de Lalaing, Sir Albert Rollit, M. Edouard Seve, Sir William Holland, and the Lord Mayor. The Diplomas were then presented by Count de Lalaing. A notable feature of the ceremony was the receipt by Burroughs, Wellcome and Co., of five awards of Grand Prix; three Diplomas of Honour, three Gold Medals, and one Silver Medal.

The American Meat Scandal.

THE effects of recent disclosures are seen on every side, letters and disclaimers reach us from various sources, and even the directors of the two great manufacturing companies, Liebig and Bovril, against whom no possible suspicion attached, are anxious to assure the medical profession and the public that their extracts are absolutely above suspicion. Last week, at the annual meeting of Liebig's Extract of Meat Company, reference was made by the Chairman to the Chicago scandal. He assured his audience that all their manufacturing departments in the River Plate were carried on under the strictest scientific control. Tuberculosis was almost unknown in the River Plate, where the company's cattle farms were situated. All the animals passed expert veterinary examination before entering the factory, and the carcasses were again inspected by a chemist after killing. The process of manufacture from beginning to end was controlled by expert chemists, while as an additional safeguard, every batch of Lemco and Oxo was analysed and tested both at the works and in Europe before it reached the trade. The company had the use of an unlimited supply of water, the river at Fray Bentos being about four miles wide, and during the whole time killing was in progress hoses played upon the tiled floors, while at the conclusion of each day's slaughter the whole place was thoroughly flushed down and left spotlessly clean.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS.

ENGLISH AND FOREIGN.

Specially compiled for THE MEDICAL PRESS AND CIRCULAR,

RECENT MEDICAL LITERATURE.

Intra-peritoneal Feeding.—Schmidt and Meyer (*Deutsch. Archiv. f. Klin. Medizin*, Bd. 85, Heft 1 and 2) report that from their experiments they find that intra-peritoneal injections of normal saline solution are rapidly absorbed in animals, and that in men suffering from uræmia or from sepsis, quantities of from one to two litres are absorbed in a day or two and cause no pain. The injections are made through a blunt needle introduced through the abdominal wall, and no wounding of the intestine has up to this been produced. They have also investigated intra-peritoneal feeding, and find that 10 per cent. solutions of grape sugar can be absorbed and consumed by dogs and rabbits without harmful effect, while solutions of lactose, maltose, and dextrin are badly absorbed and cause inflammation. The human peritoneum is more easily irritated, for after the injection of 250 ccs. of 5 per cent. grape sugar solution in a moribund individual, marked vascular injection was found at the autopsy. Egg albumen solutions (10 per cent.) were also found harmful, so that the experimenters advise that in future only 1 to 2 per cent. solutions should be tried. On the other hand, fat could be administered without causing inflammation. Further investigations seemed to show that the injection of blood serum might increase the resistance of the peritoneum to infection, if given before laparotomies, and the authors also had good results from the injection of a litre of oxygen into the abdominal cavity of an individual who was suffering from extreme dyspnoea during the course of an attack of lobar pneumonia. They had previously ascertained that oxygen gas was readily absorbed in animals. Intra-abdominal medication was also tried in a case of diabetic coma, a litre of 2 per cent. sodium bicarbonate being given, but without good result. M.

Collargol Injections.—Wassmuth reports (*Deutsch. Med. Woch.*, 1905, No. 49) two cases of septicæmia with severe symptoms and with characteristic temperature curves treated by collargol injections. After the injection of 6 cubic centimetres of a 2 per cent. solution into the median vein of the arm, both cases showed rapid amelioration of the symptoms, and the temperature fell. All the constitutional phenomena rapidly disappeared, and the delirium which was present soon passed off. Both cases made a complete recovery, but one of them required a second injection owing to a slight recurrence which took place on getting up. The injection did not cause any remarkable change in the number of leucocytes present, with the exception of a slight leucocytosis unaccompanied, however, by any alteration in the relative number of the cells. M.

Courvoisier's Law.—Moynihan contributes to the May number of the *Edinburgh Medical Journal* an interesting paper on violations of Courvoisier's law. As is well known, this law states that "in cases of chronic jaundice due to obstruction of the common bile duct, a contraction of the gall-bladder signifies that the obstruction is due to stone, while a dilatation of the gall-bladder points to obstruction due to causes other than stone. The law, however, is not inviolable, and seven cases are quoted which illustrate the exceptions that may be met with. The conclusions arrived at from the series quoted and from other illustrative cases are as follows: (1) The law may be broken when there is a stone or stricture in the cystic duct causing hydrops or empyema, together with the acute impaction of a stone in the common duct. (2) It may be broken when there is a stone in the cystic duct pressing upon

the common duct, or when there is distension of the gall-bladder by an acute inflammatory process along with obstruction of the common duct by stone. (3) Another exception is found in these cases where there is chronic induration of the head of the pancreas with a stone in the common duct, and also where there is malignant disease of the common duct along with chronic sclerosing cholecystitis. M.

Some Clinical Aspects of Syphilis.—Wild (*Brit. Journ. of Dermatology*, May, 1906) in an interesting paper bases his remarks on 1,000 consecutive cases of syphilis treated during the last twelve years at the out-patient department of the Manchester and Salford Hospital for Skin Diseases. During this period 1,043 cases of syphilis representing 1,000 individual patients occurred among 20,265 hospital out-patients, giving a percentage of 5.17. In 2,000 consecutive cases seen in private practice he found 99 cases of syphilis giving a percentage of 4.95. These figures compare favourably with those of Crocker, who found 6.1 per cent. of syphilis in 10,000 cases seen in hospital out-patient practice in London. In cases of congenital syphilis a difficulty often arises of distinguishing between a bullous syphilide and the lesion of pemphigus neonatorum. Wild considers the latter disease as due to some form of septic poisoning and had several cases which occurred in the practice of one midwife; all the cases yielded readily to simple antiseptic treatment. Among the cases of congenital syphilis in six the symptoms appeared within three weeks of birth, but the great majority first developed symptoms between four and twelve weeks after birth. Among the 55 patients with primary syphilis treated, three were children under four years of age with genital primary chancres; in each case the mothers were attending the hospital with recently acquired syphilis in the secondary stage. Wild looks on the prevention of tertiary lesions as the most important point in the treatment of syphilis, and believes that for this purpose it is necessary that mercury should be given until the onset of physiological symptoms shows that all the tissues of the body have been subjected to its influence. In ordinary cases he prefers to give mercurials by the mouth, the variety of the preparation being of little importance. He treats the patients with intermittent courses of mercury, with intervals of not more than three months, and continues this in ordinary cases for two years. K.

Clinical Observations on Ulcer of the Stomach.—Schroeder (*Amer. Journ. Med. Sciences*, May, 1906,) describes a case in which he made the diagnosis of chronic ulcer of the stomach situated in the region of the pylorus and associated with hyperchlorhydria and pylorospasm. The patient was treated by nutrient enemata and washing out of the stomach with a weak solution of bi-carbonate of soda for seven days. After this a little peptonised milk was given by the mouth, but on the twelfth day the patient vomited a considerable quantity of blood. Four days later the hæmorrhage was repeated, and the patient's condition became so bad that recovery appeared almost impossible; he gradually rallied, however, and was able to leave hospital feeling quite well three weeks later. Schroeder discusses the value of surgical interference in these cases and comes to the conclusion that it is only useful where there is organic obstruction at the pylorus, or where there has been frequently repeated hæmorrhage. In cases where the obstruction is due to simple pylorospasm he considers that gastro-enterostomy does

not afford much prospect of establishing physiological rest and drainage of the stomach. K.

Double Hemiplegia.—Rhein (*Amer. Journ. Med. Sciences*, May, 1906) records four cases of double hemiplegia, all of which ended fatally. In each case the lesion was of syphilitic origin, in one syphilitic encephalitis, in the other three cerebro-spinal syphilis. From an examination of these cases, Rhein draws the following conclusions: (1) In brain syphilis small microscopic foci of softening may occur in the cortex, the result probably of cutting off of the blood supply, and giving rise to hemiplegic symptoms and mental disturbances. (2) Syphilitic inflammatory encephalitis, while described comparatively rarely, may occur, and is probably due to inflammation originating in the small vessels of the cortex by the syphilitic poison circulating in them. (3) The change in the blood vessels is not always uniform. Sometimes the adventitia is more intensely involved and sometimes the intima. (4) Double hemiplegia, if not uncommon, is certainly not frequently described. K.

The Treatment of Arthritis Deformans with the Roentgen Rays.—Anders, Judson, Daland, and Pfahler (*Journ. Am. Assoc.*, May 19th, 1906), in a preliminary report, record two cases of arthritis deformans treated by the X-rays. In both cases the patients suffered from pain, swelling, and stiffness in the joints for the past four or five years, with great restriction of movement, some of the joints being ankylosed. The radiographic examination showed decalcification of the bones, erosion of the joint surfaces, and in some an exudate into the joint spaces. In the first case, in order to rule out any constitutional effect, only the joints of the wrist, elbow, and shoulder of the left side were selected for treatment. The man was treated three times a week, with a medium tube, at a distance of fifteen inches, with one milliamperes of current. Each treatment lasted about fifteen minutes. After the third treatment there was distinctly less pain and stiffness. In three weeks radiographic examination showed a decided improvement, and in nine weeks the joints seemed almost quite cured. Similar results were obtained in the second case. The efficiency of the treatment was all the more pronounced, inasmuch as the untreated joints did not appreciably improve. D.

Dietetic Management of Diabetes.—Croftan (*The. Gazette*, Detroit, May, 1906) insists on four points of special practical value in the dietetic treatment of diabetes. The first of these points is the danger of too much meat. Meat actually leads to sugar excretion in diabetes and excessive meat feeding favours the development of acidosis. Withdrawal or reduction of meat appreciably increases the tolerance for carbohydrates, even in mild cases. The second point is the danger of too little carbohydrates, which results in acidosis and finally coma. It is important to determine the tolerance or the so-called boundary of assimilation for carbohydrates in each case of diabetes. Third, a diabetic should receive the largest amount of fat in his food that he can possibly stand. Not only does fat spare the tissue albumins, but its caloric value is so high that it aids most materially in maintaining nutritive equilibrium. Fourth the value of the rice, potato, milk, and oatmeal cures. Croftan's experience has been limited to the oatmeal cure. He claims that if the rule is observed to stop the oatmeal cure if good effects are not seen within three days, the number of bad results will be reduced to insignificant figures. The best results are obtained in juvenile diabetics, and he urges that no case of juvenile or adolescent diabetes should be deprived of the benefit of an oatmeal cure. D.

Simple Test for Impending Mercurial Intoxication.—Severino (*Semain, Medicate*, Paris, 1906), has found that existing or impending mercurial saturation can be revealed by touching one or more of the teeth with fresh tincture of iodine. As the patient then wets the teeth with saliva, they turn pink in case of intoler-

ance or saturation, while this does not occur when the mercurial treatment is being well tolerated. The mercury eliminated in the saliva combines with the iodine to form the red biniodide if the proportion in the saliva is excessive. The proportion eliminated in the saliva is minimal when the kidneys and other emunctories are working properly, and the test gives negative findings, but when the mercury is accumulating unduly in the system this is revealed by the pink stain of the teeth after they have been touched by the iodine. D.

Addison's Disease on Traumatic Basis.—Börrmann (*Deut. Arch. f. Klin. Med.*, Leipsic, 1906) reports a case which he had opportunity to observe for four years, with the *post mortem* findings. There was not a trace of anything to suggest either tuberculosis or syphilis. The patient, a man, had fallen on the edge of an open trunk, hitting the region of the right suprarenal. He never quite recovered from the accident, and in the course of a year developed symptoms of Addison's disease, to which he succumbed three years later. Both suprarenals were found transformed into large hard tumours with necrosis in the centre, and no trace of suprarenal substance could be discovered. The solar plexus was mostly included in the tough fibrous mass forming the tumours. It is the first case on record, he says, of true Addison's disease of unmistakable traumatic origin. D.

Cirrhosis of the Pancreas in Diabetes.—Herxheimer (*Virchow Arch.*, Berlin, 1906) has had the opportunity of examining the pancreas in thirty-six cases of diabetes and his conclusions are rather against the "island of Langerhans theory." He is inclined to accept changes in the parenchyma of the pancreas as the cause of diabetes. In five cases described in detail, the alterations in the parenchyma of the pancreas were very pronounced. They were accompanied also by the efforts at regeneration characteristic of cirrhosis of the pancreas. This indicates that not only anatomically, but also physiologically, the essential injury inducing the diabetes must be sought in the parenchyma rather than elsewhere in the pancreas. D.

Senile Epilepsy Treated with Potassium Iodide.—McDougall (*Med. Chronicle*, April, 1906) records the case of a man, *æt.* 65, who early in 1905 was first attacked with an epileptic seizure. After some months the attacks became of almost daily occurrence and the patient was admitted to the David Lewis Colony. He was a strong, well-built man with no sign of organic diseases. On admission to the Colony he was given work in the joiner's shop, and 30 grs. of bromide of potassium were administered nightly. This treatment was continued for about a month, and though the patient was brighter and felt happier the fits continued with undiminished frequency. The treatment was then changed and ten grains of the iodide of potassium were given three times a day. On the fourth day of this treatment the seizures ceased, and have not returned though the dose of the drug has been greatly reduced. K.

NOTE.—A summary will appear each week in the following sequence:—(1) "Recent Medical Literature." (2) "Recent Surgical Literature." (3) "Recent Gynaecological and Obstetrical Literature." (4) "The Recent Literature of Physiology and Pathology."

THE Army Medical Department Report for 1904 has been issued as a Parliamentary Paper [Cd. 2,700]. It states that the total admissions to hospital during the year, from a force of 224,425 warrant officers, non-commissioned officers, and men, was 159,644, and the total deaths 1,592, and the total number of men finally discharged from the service on account of disease and injuries was 4,778.

NOTICES TO CORRESPONDENTS, &c.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

REPRINTS.—Reprints of articles appearing in this journal can be had at a reduced rate, providing authors give notice to the Publisher or Printer before the type has been distributed. This should be done when returning proofs.

AN ALLEGED BREACH OF ETIQUETTE.

We understand that the reports published in the newspapers, and referred to in our issue for May 30th, regarding an alleged breach of professional etiquette by Professor W. R. Smith in sending a circular letter to sundry Metropolitan mayors, had very little foundation in fact. We are glad to learn that Dr. Smith entirely repudiates the allegation, and that the letter referred to was sent to the mayor of one district only as a private friend. Any of our comments, based on erroneous newspaper reports, we, of course, willingly withdraw. It appeared to us at the time hardly credible that such a step could have been taken by a gentleman occupying so prominent a position in the medical world.

QUARANS (Chichester).—The most recent available statistics of the Metropolitan Asylums Board on the point are those for May, 1906. They return five cases of small-pox under treatment as against ten and six at the end of the two preceding months. These figures would have been much more disquieting had not the amount of susceptible material in the metropolis been considerably reduced by the epidemics of the last few years.

E. L.—Your letter is unavoidably crowded out.

M.R.C.S. (Liverpool).—Quite a partisan statement. Take no notice of it under existing circumstances.

Dr. F. S. T. will find the subject fully referred to in our Editorial columns last week.

ROBUSTOR (Carna).—The best circulating medical library is Mr. H. K. Lewis', 136 Gower Street, London.

PRESCRIPTION WRITING.—LATIN v. ENGLISH.

APROPOS of recent correspondence concerning medical prescriptions, whether they should be written in Latin or plain English, our contemporary, *The Globe*, tells the story of a physician, who, prescribed syrup of buckthorn for an old lady, wrote it in the usual form, "Syr. Ram. Cat." When she called again, he asked her whether she had taken the medicine. "No," she replied, indignantly, "I ain't a goin' to take ram cats for anybody."

CLINICAL LECTURES.

We have Clinical Lectures in hand by the following, the receipt of which is hereby acknowledged:—

"**Hæmatemesis.**" By Geo. Pester Chappel, M.D.Cantab., M.Ch., Physician to Tottenham Hospital (lecture delivered at the North-East London Post-Graduate College).

"**The Hæmoptysis of Tuberculous Subjects.**" By Prof. G. Lemoine, M.D., of the Paris Faculty of Medicine.

"**Some Points regarding Empyemata.**" By Herbert S. French, M.D.Oxon., M.Ch., M.B.C.P.Lond., Medical Registrar of Guy's Hospital (lecture delivered at Guy's Hospital).

"**Carcinoma.**" By Chas. B. Lockwood, F.R.C.S.Eng., Surgeon to St. Bartholomew's Hospital (lecture delivered at St. Bartholomew's Hospital).

"**The Diagnosis and Treatment of Ringworm.**" By G. Norman Meschen, M.D.Lond., B.Ch., M.B.C.P.Lond., Physician for Diseases of the Skin to the Tottenham and the West London Hospitals (lecture delivered at the North-East London Post-Graduate College).

"**Fæces Abscess, its Nature and Treatment.**" By B. C. Yelverton Pearson, F.R.C.S., F.R.U.I., Professor of Surgery in Queen's College, Cork (lecture delivered in Queen's College).

"**The Value of Philipowicz and Bernard's Signs in the Diagnosis of Typhoid Fever.**" By Prof. Louis Regis, of the Paris Faculty of Medicine.

"**The Surgical Aspects of Tubercular Peritonitis.**" By Francis J. Steward, M.S., M.B.Lond., F.R.C.S., Assistant Surgeon to Guy's Hospital and to the Hospital for Sick Children (lecture delivered at Guy's Hospital).

"**The Clinical Examination of the Blood.**" By Arthur Whiting, M.D., M.B.C.P.Lond., Dean of the North-East London Post-Graduate College, Physician to the Tottenham Hospital and to the Mount Vernon Hospital for Diseases of the Chest (lecture delivered at the North-East London Post-Graduate College).

Meetings of the Societies, Lectures, &c.

WEDNESDAY, JUNE 20th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chelms Street, W.C.).—4 p.m. Mr. P. J. Freyer: Clinique. (Surgical). 5.15 p.m. Lecture.—Mr. E. T. Collins: Cataract (with lantern slide demonstration).

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. F. Taylor: Medicine. 3.15 p.m. Mr. M. Robson: Surgery. 4 p.m. Mr. Cargill: Ophthalmology. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

THURSDAY, JUNE 21st.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chelms Street, W.C.).—4 p.m. Mr. Hutchinson: Clinique. (Surgical). 5.15 p.m. Lecture.—Sir J. McFadyean: Anthrax.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. G. Rankin: Medicine. 3.15 p.m. Sir W. Bennett: Surgery. 4 p.m. Mr. M. Davidson: Radiography. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Ear and Throat.

FRIDAY, JUNE 22nd.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chelms Street, W.C.).—4 p.m. Mr. A. Lawson: Clinique. (Eye).

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. R. Bradford: Medicine. 3.15 p.m. Mr. McGavin: Surgery. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 12 noon. Skin.

SATURDAY, JUNE 23rd.

SOCIETY FOR THE STUDY OF DISEASE IN CHILDREN (Radcliffe Infirmary, Oxford).—3 p.m. Country Meeting. Papers by Dr. G. Carpenter, Dr. B. Rogers, Dr. E. C. Williams, Dr. Collin, Dr. A. G. Gibson, and Dr. H. Croly. Exhibition of Clinical Cases, Pathological and Anatomical Specimens.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Out-patient Demonstrations:—10 a.m. Surgical and Medical. 11 a.m. Eye.

MONDAY, JUNE 25th.

ODONTOLOGICAL SOCIETY OF GREAT BRITAIN (20 Hanover Square). 8 p.m. President's Valedictory Address. Short Papers:—(I) Mr. J. F. Colyer, L.R.C.P., M.R.C.S., L.D.S.: On Some Odontomes in the Museum of the Society" (illustrated with lantern slides). (II) Mr. F. Lawson Dodd, L.R.C.P., M.R.C.S., D.P.H., L.D.S. Some Notes on Oral Conditions in Relation to Tuberculosis.

Vacancies.

City of Leeds.—Assistant Medical Officer of Health and Chief Inspector of Nuisances. Salary £300 per annum. Applications to Robert E. Fox, Town Clerk.

Egyptian Government.—Ministry of Education.—Professor of Midwifery and Gynecology. Salary £400 a year. Applications to the Director, School of Medicine, Cairo, Egypt.

Egyptian Government.—Ministry of Education.—Medical Tutor and Registrar to Kasr-El-Ainy Hospital. Salary £400 a year. Applications to the Director, School of Medicine, Cairo, Egypt.

Poplar Hospital for Accidents, Poplar, E.—Senior House Surgeon. Salary £135 per annum, with board and residence. Applications to Percy Rogers, Secretary.

Cambridgehire, &c., Asylum.—Senior Assistant Medical Officer. Salary £150 per annum, with board, lodging, and attendance. Applications to T. Musgrave Francis, Clerk to the Visitors.

St. Bartholomew's Hospital and College.—Demonstrator of Chemistry. Salary £150 per annum. Applications to T. W. Shore, Dean.

St. Bartholomew's Hospital and College.—Demonstrator of Physics. Salary £150 per annum. Applications to T. W. Shore, Dean.

Devon County Asylum.—Third Assistant Medical Officer. Salary £140 per annum, with board, lodging, washing, and attendance. Applications to Medical Superintendent, County Asylum, Exminster.

Cardiff Asylum.—Medical Superintendent. Salary £850 a year, with unfurnished house, light, coal, vegetables, and washing. Applications J. L. Wheatley, Town Clerk.

Jadray Branch of the General Hospital, Gravelly Hill, near Birmingham.—Resident Medical and Surgical Officer. Salary £150 per annum, with board, residence, and washing. Applications to the House Governor, General Hospital, Birmingham.

Appointments.

BRENNER, C. [S., M.D.Édin., D.P.H.Camb., Medical Officer to the Education Authority, Widnes.

COLLISON, HAROLD, M.B., B.S.Lond., F.R.C.S.Eng., Surgical Registrar to the General Infirmary, Leeds.

KITCHEN, H. E., M.B.O.S., L.R.C.P., House Surgeon to the Tottenham Hospital, London, N.

LANGLEY, ALFRED FARDON, M.D., C.M.McGill, L.R.C.P., L.R.C.S., L.M.Édin., L.F.P.S.Glasg., District Medical Officer by the Bath Board of Guardians.

O'DONNELL, JOHN, Visiting Medical Officer to Kilmatham Prison.

RIDOUT, C. A. SCOTT, M.S.Lond., F.R.C.S.Eng., Surgeon to the Aural and Throat Department of the Portsmouth and South Hants Eye and Ear Infirmary.

WALKER, THOMAS WARBURTON, M.B., Ch.B.Vict., District Medical Officer by the Tebbury (Gloucestershire) Board of Guardians.

WATSON, GEORGE W., M.D.Lond., M.B.C.P., Medical Registrar to the General Infirmary, Leeds.

Births.

GASKELL.—On June 11th, at Briar's Hey, Stechford, Birmingham, the wife of Leonard S. Gaskell, M.A., M.B., B.C.Cantab., of a son.

SAW.—On June 15th, at 27 Junction Road, Southsea, the wife of Major F. A. Saw, R.A.M.C., of a daughter.

Marriages.

YEARSLEY-SECKENDORFF.—On June 14th, at St. Thomas's Church, Orchard Street, London, Percival Macleod Yearsley, F.R.C.S., Senior Surgeon to the Royal Ear Hospital, to Lavinia Rose, widow of the late Siegmund Seckendorff, Esq.

Deaths.

RINGER.—On June 12th, at 20, Lansdown Terrace, Cheltenham, Dep. Surgeon-General Theobald Ringer, M.B., Indian Medical Service, late 7th Bengal Cavalry.

SKRIMSHIRE.—On June 8th, at Bag Enderby Rectory, the Rev. Arthur James Skrimshire, M.D.Édin., J.P., Rector of Somersby and Bag Enderby, Lincolnshire.

TAYLOR.—On June 15th, at Derby, of heart failure, Charles Henry Taylor, M.B., F.R.C.S., aged 48.

TROTTER.—On June 14th, at 4, St. Peter's Terrace, York, Surgeon-Colonel J. W. Trotter, late Coldstream and Scots Guards, eldest son of the late J. Trotter, M.D., of Durham.

NOTES AND COMMENTS.

The Blaenavon Case.

THE recent embroilment at Blaenavon, which ended in the erasure of Dr. Bawden's name from the Medical Register, has excited a good deal of public comment.

As most of our readers are aware, two local practitioners had refused appointments to a local Tradespeople's Doctors' Fund, on the ground that the committee had canvassed the district, and, without any authority, had announced them as medical officers. Dr. Bawden was then introduced into Blaenavon, and his name widely circulated by the Fund in a further canvass. After various warnings from official bodies, Dr. Bawden gave up the post, but proceeded to circularise some of the members personally and by letter. For this last offence he was struck off the *Register* by the General Medical Council. In certain quarters this sentence is stigmatised as one of tyrannical and malignant cruelty. Most medical men will think otherwise, and will congratulate themselves that the Council, albeit in a roundabout fashion, is able to do something for the good of general practitioners. Sometimes the action of the Council has seemed to savour somewhat of persecution, but in a case like that of Blaenavon their disciplinary powers afford the sole safeguard against practices that have always been condemned by an honourable profession.

For Fees within Only!

THE disciplinary powers of the General Medical Council are mainly domestic. It is to that disastrous condition of affairs that the present unhappy plight of the general

practitioner is attributable. The Council enforce a cast-iron discipline upon duly qualified men, but at that point their duty ends, at any rate, so far as the defence of the legally qualified is concerned. The result is that after a costly education the practitioner finds himself faced with a laborious life in which he is handicapped by the ceaseless competition of illegal medical practice of all kinds, such as bone-setting, electrolysis, electrical treatment, and often undisguised quack medical practice of various kinds. How long will the profession tolerate a Council that makes no attempt to defend them against this piracy? The answer is probably that the policy of the Council will never be altered materially until its constitution is radically changed, so that instead of representing the interests of a number of corporate bodies, it becomes the champion of the

whole profession. That consummation, however, does not appeal to the majority of the Council, as shown by their recent contemptuous refusal to increase the number of direct representatives. What is there to fear so much, we wonder, in members chosen by general practitioners?

Shoddy Learned Titles.

FOR years past there has been a growing tendency amongst persons not possessing the right to add recognised and legitimate letters after their name to secure others from the most curiously unexpected quarters. Thus photographic societies have their members and fellows, herbalist societies (a sort of quack medicine cult) follow the same practice, together with friendly societies, salvationists and all kinds of bodies, eclectic, learned, semi-learned, social, scientific, semi-scientific, and what not. As a rule, the vanity is transparent and may be dismissed with a passing smile. Now and then the assumption is fraudulent, as when a quack uses the letters M.S., implying he is a surgeon, and explaining it as student of medicine or of music or some equally misleading description. Certain ambulance students have recently been unwise enough to add the letters M.B., M.A. to their names. The serious nature of this offence against good taste has brought the matter under the official notice of the British Medical Association.

Value of Ambulance Work.

IN the case of the St. John's Ambulance Association it must be particularly vexatious to the leaders of the movement to note such un wisdom on the part of any of their flock. The success of their work has been conspicuous. It has supplied to the man in the street that practical knowledge of how to meet accidents and sudden illness which he may find of incalculable value at any moment. Such knowledge is indeed power, and its possession converts the helpless onlooker into a skilled assistant able to prevent suffering, and it may be to save life and limb. Of course, there is a tendency on the part of the Ambulance student to make too much of his half knowledge, but none the less he is a distinctive and valuable product of our latter-day humanity. It would be a thousand pities were a handful of foolish ambulance students to bring discredit on a great national organisation by their attempts to impose on the public by borrowed plumes. Nor is it likely that they will escape reprimand from headquarters.

LEADING ARTICLE.

THE NEWSPAPER PRESS AND QUACKERY.

WE have full warrant for the statement that the attitude taken up by us with regard to quackery and the newspaper press has the approval of the profession, and we propose to keep the question to the front, by devoting space to it if necessary every week, until we shall have done what lies in our power to abate or put an end to the scandals and evils we have already to some extent exposed. Whatever we may achieve in this direction must be very far more to the advantage of the public than the profession. It may, indeed, be worth while once more to point out, as we have on several occasions previously explained, that it is at least extremely doubtful whether from the sordid point of view quackery does any harm whatever to the legitimate practitioner, whilst on the other hand it is certain that it forms for him a constant source of profit. Quackery constitutes a potent factor in deterioration of the public health: It manufactures invalids; it converts simple into chronic diseases; it renders chronic cases incurable. The great majority of victims from the hands of quacks gravitate sooner or later into those of qualified men, and money which would not otherwise be earned is thus put into the pocket of the profession. So far, therefore, as motives are concerned, the profession and its organs in the press may go into the fight against quackery with a clear conscience. It is a fight in which no lover of humanity, knowing the facts and having the power, could refuse to take part. The medical profession has hitherto remained almost powerless. Without the help of the lay press it has been impossible to prove their unselfishness; impossible to keep the facts clearly, fully, and persistently before the public until they might become understood and accepted by all the classes who need enlightenment. Quackery is a gigantic evil; it is rapidly growing, and its growth to a very great extent is due to the fact that no matter how gross and palpable the fraud, or even if the fraud has been exposed and stigmatised in the Courts of Law, the advertisement finds unquestioned admission into almost every newspaper. No doubt the proprietors and managers are often not fully aware of the nefarious character of the traffic they are abetting; we hope before we have done to dissipate any doubts in this regard. Many of the smaller papers are ashamed of the use to which they allow their advertising columns to be put, but when challenged on the subject excuse themselves on the plea that similar announcements are admitted to all the principal papers, from the *Times* downwards. This plausible, if not valid excuse, has reached us in more than one instance, and the fact that it can be put forth renders it imperative that reform shall begin in the leading journals. We must convince these papers that quackery is a system of fraud more cynical and more cruel than any practised by the great army of malefactors who live and amass

wealth by preying upon the public by the various methods of chicanery, which, practised with sufficient cunning, leave them clear of the meshes of the law. Quackery in its least hurtful form, as exemplified in "hair restorers" and bogus cosmetic preparations of a similar kind, merely picks the pockets of its victims; but many purveyors of such articles, among whom must be included a certain class of quack dentist, make their money by extortion or even blackmail practised upon the foolish women for whom they lay themselves out. The simplicity of such women may be gauged by the fact that enormous sums, for which ample returns must be made, are spent on advertising such gross swindles as mechanical apparatus warranted to cure organic deformities of the features. Quackery in its more harmful forms is a cause of suffering, misery, and death, and these results are brought about not only by quack practice, but by the lying advertisements of absolutely worthless nostrums upon which the victims of serious disease are induced to rely. In attacking the newspapers for their conduct in regard to quackery we have first singled out the *Times*, for the reason that, whilst nearly all the other leading papers have always admitted quack advertisements, the *Times* has until lately remained as honourably distinguished in this matter as it has been superior in the tone and quality throughout of its editorial pages. Not only did the *Times* formerly, for many years, refuse advertisements of a kind which brought in enormous incomes to its contemporaries, but it also took every occasion to expose and condemn medical quackery in every form. From its leaders on the subject we have frequently quoted. The proprietors have only to refer to their files of former years to learn, if, as appears, they have forgotten the character of the traffic to which they are now giving countenance. To the other great London journals, the *Morning Post*, the *Daily Telegraph*, the *Daily Mail*, and the *Standard*, we shall in due course devote more direct attention. In the matter of quack advertisements, they are all offenders. The three first named are all owned by Peers of the Realm. Each of these noblemen has made his position and gained his wealth by means of the paper he owns. Here, surely, if anywhere, is a case of "*Noblesse oblige*"; these wealthy noblemen dare not for shame stoop knowingly to augment their incomes by abetting, however remotely, the cowardly wretches who live by the plunder of suffering humanity. They may be shocked to be told that any portion of their income is at present derived from such a source; they can easily verify the statement by inquiring into the character of quack advertisements to which they give publicity. They may easily learn further that the appearance of these fraudulent announcements in the columns of leading journals, especially when under such distinguished ownership, is taken by many of the simple public as a guarantee of the good faith of the advertisers, and many a victim who might otherwise not be caught is thus inveigled into hands where robbery and maltreatment await him.

NOTES ON CURRENT TOPICS.

Army Medical Reform.

Two eminent men, well-qualified to speak about Army and medical administration, have recently insisted upon the necessity for instructing officers and men of the land forces in sanitation and hygiene. They are Mr. St. John Brodrick and Sir Frederick Treves. The former recalled the fact that at Walcheren, in 1804, the British loss from wounds was sixteen per thousand, as against 34·7 from disease. In the Crimea the corresponding figures were 150 and 230, while recently in South Africa they were 42 and 69. The sickness-rate in the last-mentioned campaign, however, was enormous, as there were 746 per thousand admissions to hospital for disease, as against 34 for wounds. Since the war much has been done to increase the strength and efficiency of the R.A.M.C. The fatal trend in the present system, however, appears to be in the subordination in sanitary matters of the medical to the combatant arm. The only path of safety is that which hands over to a skilled scientific officer the supreme control of camps, water supplies and other sanitary matters. The more that officers and men learn to appreciate the value and necessity of hygiene the more ready will they be to obey medical orders. The Director-General, according to Mr. Brodrick, should have a seat on the Army Council, and be independent of the Adjutant-General. In our opinion the medical branch of the service is one of paramount importance to the general efficiency of the Army.

A Medium Exposed.

THE cult of spiritualism appears to be founded and maintained by a carefully organised system of fraud. At any rate, exposure of some gross roguery or other invariably follows anything like a skilled and resolute investigation of its alleged phenomena. Hence it is reasonable to suspect that trickery lurks behind other spiritualistic wonders, even where it is difficult or impossible to demonstrate its existence. For obvious reasons the greater number of spiritualistic professors—if that term may be used—escape detection. Now and then, however, they are enmeshed in the nets of the hunter, but the matter usually ends with a few humorous paragraphs in the daily newspapers. The exposure of one Craddock, however, last week in Edgware Police Court, had a more eventful ending in the shape of a fine of £10, and five guineas costs, or in default a month's imprisonment. The exposure was made by a stalwart Colonel, who was told that the spirit of a brother officer had come to him. A face, with a very fuzzy and much turned-up moustache appeared to him through the gloom of the darkened room. The gallant Colonel then seized the pair of shoulders corresponding to the ghostly face and held on, while another officer flashed a light on the scene, and revealed Craddock, the medium, playing the part of the visiting spirit. The Colonel and his comrade paid half a guinea each for admission to

the séance, but their fees are presumably paid by the *Daily Express*, which is the real prosecutor. It would be a great boon to the public were some of our energetic newspaper proprietors to attack the far more noxious trade in quackery and patent medicines, compared with which spiritualism is a lame affair. Fraudulent nostrum vendors wax rich and pay large sums for advertisement whereas spiritualists carry on operation—and advertise—on a small scale.

Marriage and Degeneracy.

PHILOSOPHERS since the dawn of history have from time to time endeavoured to frame laws with a view of raising the physical standards of their countrymen. The most logical attempt was perhaps that of Sparta, which in ancient times destroyed forthwith all infants who showed bodily defects. There are many arguments, however, against the discharge of such a function by the State. The mere fact that some of the best intellects are associated with defective frames is alone sufficient to condemn any scheme which aims at the exclusion of bodily degenerates. In short, the evolution of mankind must apparently be guided in the future mainly by such natural laws as sexual selection and the lessened chances of survival of degenerates in the struggle for existence. At the same time, a great deal might be effected by the growth of higher general morality especially as it affects marriage. Perhaps one of the most fertile sources of national degeneracy is the marriage of the unfit. What reasonable objection could there be to a law prohibiting the marriage of persons actually insane, consumptive, or syphilitic? Clearly there is much to be said in favour of a medical examination of all candidates for matrimony. A Roumanian professor, Dr. Torna Torneska, is evidently an enthusiastic supporter of that view. He has actually introduced into the Roumanian Senate a Bill prohibiting marriage to all persons affected with chest diseases, organic affections of the heart, general paralysis, or any infectious disease which might prove injurious to their offspring. Although there is not much chance of any such Bill becoming law, there is always an educational value attached to the airing of important abstract theories of the kind in legislative chambers.

School Boards and Medical Officers.

IT is no less interesting than encouraging to note the growing tendency on the part of the medical profession to organise for definite practical purposes. In Dundee, a representative meeting of medical men was recently held at the instance of the local branch of the British Medical Association. Their object was to discuss the proposed appointment of a medical officer to the School Board. The meeting was practically unanimous in resolving that it would be improper for any member of the profession to undertake the post in question under the proffered conditions. The chief objections were that the duty and responsibility of the family attendant would

be unduly interfered with, that the prescribed form of certificate involved a breach of professional confidence, and that emoluments and other conditions of employment were unworthy of acceptance. The situation, thus clearly defined, seems based upon perfectly fair and understandable grounds. Unfortunately, the usual candidate of "independent" views, who is content to accept the post on any conditions, has appeared upon the scene. If the contentions of the local association be correct, the Defence Societies and the General Medical Council may have some future say in the matter to this gentleman.

Academic Medical Costume.

THERE is much to be said in favour of the practice of wearing academic robes at public functions. Picturesqueness is a feature of social life the value of which no community, however sober and sedate its national character, can afford altogether to set aside. Even the Puritans of the Commonwealth, in their search after austere ideals, adopted a dress that to this day forms a favourite model for painters. So far as the medical profession is concerned, they have never been much given to wearing college robes on public occasions. It is one of the signs of the times, perhaps, that of late years the tendency to appear clad in distinctive costume on state occasions has seized more or less upon the professional imagination. The annual medical gathering at St. Paul's Cathedral has given a considerable impulse to the robe-makers' business. Indirectly it has led to the demand for distinctive robes from Colleges that had been hitherto content to exist—in some cases for hundreds of years—without any such outward and visible sign of learned confraternity. That the practice is growing in popularity may be gathered from the fact that academic costume is to be worn at this year's Prize Distribution at Guy's Hospital, when the presentations will be made by Sir W. Cameron Gull, Bart., and all visitors are expected to be duly robed.

Recognition of Urinary Deposits.

A SURE and rapid method of enabling a medical man to recognise all the elements in a urinary deposit under the microscope has long been wished for. The usual stains can be employed and give more or less help at different times and with different elements in the deposit, but unfortunately the stains diffusing through the fluid in which the deposit is suspended render the contrast weak, even if they succeed in fixing the elements themselves. Without stains the difference in refraction between the fluid containing the casts and the casts themselves is so little that it is difficult to distinguish outlines accurately. An ingenious way of overcoming these difficulties has been devised by Amann, who finds that if finely divided pigments are used instead of diffusible stains the fluid is coloured deeply and the elements themselves are unstained. Consequently they stand up sharply against a dark background and are readily distinguished. Amann suggests the use of

ordinary Indian ink, such as is used by black-and-white artists, or Prussian blue, for the purpose. A drop of the fluid to be examined is placed on a stick, a touch of the pigment added, and the whole placed under a cover glass, when a dark groundwork of colour is obtained against which the elements of the deposit appear in sharp contrast. This simple and ingenious plan is well worthy of trial.

The Sale of Poisons.

THE Council of the Pharmaceutical Society have issued to the chairmen and secretaries of County Councils throughout Ireland an important circular with reference to the proposed abolition of some of the restrictions on the sale of poisons. It points out that there is at present no practical inconvenience entailed on farmers by the restriction of the sale of sheep-dips and other such poisons to qualified persons, since there are about fifteen hundred people qualified to keep open shop for the sale of poisons, in addition to many apothecaries. As there are thirty-two counties in Ireland, it follows that there are about fifty registered druggists for each. As in the agitation on the subject special reference has been made to sheep-dips, the circular does well to mention that several of the best dips are non-poisonous, and that two of the three recommended by the Department of Agriculture are non-poisonous. It has to be impressed on the public that the restrictions on the sale of poisons are in the interest of the public, and not of any trade or craft. We hope that the Pharmaceutical Society will meet with success in this endeavour.

Enteric Fever in an Asylum.

ON Saturday, the 23rd inst., the Metropolitan Asylums Board was notified of a serious outbreak of enteric fever at one of the newest institutions, namely, Belmont Asylum. The report of the Asylums Committee showed that up to June 18th fifty-four patients had been attacked, as well as two attendants. There had been four deaths, in two of which, however, the primary cause was returned as tuberculous. It is not surprising to learn that this report gave rise to an animated discussion at the Board, where the explanatory remarks of the Chairman of the Asylums Sub-Committee were sharply criticised. As one member pointed out, here was "the first sanitary authority in the world," which had allowed an epidemic of that kind to drag on until the district authority had been compelled to ask the Local Government Board to look into the matter. From the chairman's statements it appears that there were no nurses in the Asylum, but that at the end of twenty-one days, when there were forty-five patients, two male nurses were engaged. Even at the time of the report, incredible as it may seem, the cause of the outbreak had not been ascertained. If these things be true, then it is indeed time the Metropolitan Asylums Board ceased to be a nominated body and came under popular control. Money has been always spent by the Metropolitan

Asylums Board like water. One of the complaints against its administration has hitherto been the over-staffing of its institutions. Yet, in the case of Belmont, if the official statements made on Saturday last are to be accepted, we find forty-five patients suffering from typhoid fever placed under the care of two nurses. If no better provision were made in the hurry and confusion of a great campaign it would arouse the public indignation. In a great metropolitan Board with unlimited resources, whose watchwords are up to date science and perfect organisation, the possibility of an occurrence of this kind simply illustrates to our mind the laxity that is bound to creep in where the administration is not subjected to the unceasing vigilance of popular control.

The Studio Murder

THE extraordinary crime which not long ago sent a great shudder of horror through the metropolis is fast fading away into the region of seven-day wonders. An attempt has been made in certain quarters to revive interest in the murder by sensational statements as to the hushing-up of the affair by the police. It may or may not be the case that the authorities have taken the very serious responsibility of sending the criminal out of the country, and of taking steps to stop inquiry into a wide-spread scandal involving many persons. In the interests of public morality there is much to be said in favour of such a course, assuming that the crime involved is of the nature hinted at. There appears to be little reasonable doubt that the murdered artist was the victim of a moral mania that led to sexual perversions of a well-recognised type. There is, further, little doubt that he met with his death after the commission of that particular offence, possibly by reason of a sudden homicidal impulse on the part of his confederate. A recently-published theory states that the murderer was first drugged into insensibility, and on his recovering consciousness was seized with a sudden fierce paroxysm of rage. To this we must demur. The whole occurrence occupied only comparatively a small period of time, and no drugs are known to medical science that, administered in a glass of wine, can rapidly rob a victim of consciousness for a few minutes. Such incidents occur only in the experience of novelists and of journalists, not of medical men.

PERSONAL.

IT is announced that the King, on the occasion of the opening of the Sanatorium at Midhurst, has made the following appointments:—To be Member of the Fourth Class, Grand Cross, Mr. C. T. Williams, M.D.; to be Member of the Fifth Class, Mr. P. H. S. Hartley, M.D. Honorary Secretary of the Executive Committee of the King Edward VII. Sanatorium.

MR. HALDANE, Secretary of State for War, on June 25th, formally opened the building which has been recently added to the National Physical Laboratory at Teddington. The new building is intended to accommodate the electro-technical and photometric

work at present carried on in the Physics Laboratory. The Chairman at the opening ceremony was Lord Rayleigh, the President of the Royal Society, and Chairman of the General Board of the Laboratory.

THE annual dinner of the Indian Medical Service was recently held in the New Gaiety Restaurant, London, under the presidency of Surgeon-General L. D. Spencer, C.B.

THE prize of £50 and the gold medal of the Alexander Memorial Fund for 1905 has been awarded to Major F. Smith, D.S.O., R.A.M.C., for his essay on "Syphilis in the Army: its Causes Treatment and Prevention."

DR. R. MURRAY LESLIE has, on the recommendation of M. Cambon, the French Ambassador, received the Order of Officier d'Academie Francaise.

The new public analyst for Portsmouth, who was chosen from 29 candidates for the post to succeed Mr. Edward Russell, is Mr. F. W. F. Arnaud, F.I.C., F.C.S. Mr. Arnaud has been assistant to Mr. C. H. Cribb, the public analyst for the Westminster and Fulham districts, for over eight years, and during this time has performed valuable research in several branches of chemical analysis.

DR. R. S. EARL, Commissioner and Medical Officer of the Virgin Islands, has left the Colony on leave, during which Dr. C. O. Wynne, District Medical Officer of St. Kitts, will carry on his combined duties.

DR. WILLIAM ROBERTSON, of Bellcairn, Dumbartonshire, who died on May 6th, has left personal estate in the United Kingdom valued at £61,057 2s. 4d., of which £33,332 1s. 5d. is in Scotland.

DR. HANDFORD, having resigned the office of hon. physician to the Nottingham General Hospital, members of the have in order to mark their high appreciation of the great services he has rendered to the institution, presented him last week with a silver bowl, and an illuminated address.

DR. W. T. PROUT, C.M.G., Principal Medical Officer of Sierra Leone, is retiring from the Public Service on pension. He became Assistant Poor Law Medical Officer in Mauritius in 1885, and three years later was transferred to the Gold Coast, where he also acted as a District Commissioner. He succeeded the late Sir D. Palmer Ross as Principal Medical Officer of Sierra Leone in 1895, and was a member of the Legislative Council of that Colony. Pending the appointment of a successor to Dr. W. T. Prout the duties of Principal Medical Officer of Sierra Leone will be performed by Dr. T. Hood, who has served in that Colony for the past nine years.

DR. A. W. SIKES, M.R.C.P., F.R.C.S., has been awarded the degree of D.Sc. in Physiology, by the University of Oxford, for four papers, entitled, (a) "On the Phosphorus of Human Milk," (b) "On the Estimation of Proteid in Human Milk," (c) "On the Calcium of Human Milk," (d) "On the Globulin of Albuminous Urine."

THE death of Herr Fritz Shaudinn, one of the discoverers of the *spirochete pallida*, the supposed organism of syphilis, is reported from Hambourg.

THE two English doctors who were maltreated by a mob at Tung-ngan, are stated to have recently arrived at Amoy. Dr. Horne was nearly disembowelled, and left for dead. He contrived, however, to crawl to the American Mission, where he had been previously staying.

A CLINICAL LECTURE ON THE CLINICAL EXAMINATION OF THE BLOOD.

Delivered at the North-East London Post-Graduate College on May 10th, 1906.

By ARTHUR WHITING, M.D., M.R.C.P.Lond.,

Assistant Physician to the Tottenham Hospital, N., and the Mount Vernon Hospital for Consumption and Diseases of the Chest, and Dean of the College.

THE diagnosis of diseases of the blood is usually made, in the first place, on the facial appearance of the patient, particularly the pallor of the conjunctival and buccal mucous membranes, together with such clinical signs as dyspnoea on exertion, blueness of the sclerotic, a venous hum in the neck, and basic systolic murmurs, and in the second place on an examination of the blood. It is with the second and somewhat more difficult matter—the clinical examination of the blood itself—that we are concerned this afternoon.

GENERAL CHARACTERS OF NORMAL BLOOD.

The blood, as you know, consists of cells floating in a fluid, the blood plasma or liquor sanguinis. The cellular elements consist of red blood corpuscles or erythrocytes, white blood corpuscles or leucocytes, and blood plates. The red blood corpuscles contain hæmoglobin which has the function of carrying oxygen from the lungs to the tissues, a deficit in which is the factor in anæmia that threatens life. The red cells themselves, you remember, are bi-concave non-nucleated discs, from 7 to 8 micro-millimetres in diameter, numbering in healthy men about 5,000,000 per cubic millimetre, and 4,500,000 in healthy women. The leucocytes are colourless nucleated cells of several different forms, numbering from 5,000 to 8,000 per cubic millimetre.

The blood plates, about which but little is known, are round colourless bodies varying in size from perhaps one-tenth to one-third of the size of a red blood corpuscle, and numbering, perhaps, 200,000 in the cubic millimetre. I do not intend to take up much time by discussing these elements to-day, beyond saying now that they are probably concerned largely with blood coagulation. If a specimen of fresh blood be freed from red cells, it will be found that the blood plates form the nodes of the fibrin network; it is probably from them that deposition of fibrin occurs. In making some experiments on artificial anæmia in dogs some years ago, I had to remove blood from the jugular vein through a cannula, which was, of course, done under an anæsthetic, and I several times noticed that the last portion of the blood to be removed clotted very much more rapidly than the earlier, and examination showed it to be much richer in blood plates than the normal. A corresponding fact is that in hæmophilia, where the coagulating power of the blood is very defective, blood plates are in very small numbers.

STEPS IN THE EXAMINATION OF THE BLOOD.

There are at least five important steps in the examination of the blood that can fairly be called clinical, and are sufficiently rapid as to be suitable for use in active medical practice. These are (1) the microscopic examination of plain fields of blood freshly drawn by needle prick from the body; (2) the estimation of the number of the red blood corpuscles; (3) the estimation of the number of the white blood corpuscles; (4) an estimation of the amount of hæmoglobin; and (5) the microscopical examination of dried and stained films of blood to show the presence or absence of abnormal cell elements in the blood and the relative proportion of the different varieties of leucocytes.

The specific gravity and other physical characters of the blood, its chemistry, and its spectroscopy on the one hand, and its vital serum reactions, its bacteriology, and its parasitology on the other, cannot now be taken into account.

EXAMINATION OF FRESH SPECIMENS.

Very much may be learned from merely looking

with the microscope at a thin layer of fresh blood. Such a preparation is easily made, and need not take more than a minute or two. The tip of the finger is probably the best place from which to obtain the blood, although the lobe of the ear is nearly as convenient. The skin may be rubbed with a damp towel and then dried; the prick is conveniently made with a clean needle, and little or no pressure should be exerted to make the blood flow. A clean cover glass is applied to the drop, and then placed flat on a slide, when the blood spreads itself between the two by capillarity. Such a preparation will show the following points: Whether or not the individual red cells are of a good yellow colour, indicating a sufficiency of hæmoglobin; whether they are of uniform size; if some are large, macrocytes, and others small, microcytes, some stress on blood formation is probably indicated; whether the shape be regular—in very grave anæmias the red cells may be pyriform, with several processes, or almost any shape derived from the disc, in which case poikilocytosis is said to be present; whether the corpuscles form rouleaux rapidly and perfectly as in health or not; whether the fibrin network is dense and regular or not (a good way of ascertaining this is after a fairly thick layer has clotted to put a drop of a weak solution of methylene blue on one edge of the cover and a piece of blotting paper at the other; the watery stain is drawn through the preparation dissolving the red cells and leaving the fibrin network apparent and stained); whether the leucocytes are in considerable excess or not, normally there is about 1 to 1,000 reds, but in leukæmia there may be 1 to 100, or 50, or 20, or even an equal number. It is sometimes difficult to recognise the leucocytes without staining them, but if the upper level of the preparation be focussed they give a silvery shimmer which reveals them, or if the cover be tapped the red cells move about, but the white, being adherent to the glass, remain stationary; ordinarily they are visible in the wide meshes formed by the rouleaux. Lastly, a rough idea may be gained after a little practice as to the number of blood plates as compared with the number of the red cells.

ESTIMATION OF THE AMOUNT OF HÆMOGLOBIN.

For ordinary purposes, and especially for determining at regular intervals the progress of an individual case, and particularly in view of the ease and rapidity with which the information is obtained, the next step should, I think, be the estimation of the amount of hæmoglobin present. For doing this there are several methods, but I shall ask you to consider two only. The easiest, quickest, and cheapest of all is the Tallquist method. A drop of blood is placed on white blotting paper and compared with a printed colour scale like that I now show you. The other method is that with Gowers's hæmoglobinometer, which I also show you. It consists of two small test tubes of identical calibre, one of which is filled with glycerine jelly tinted with picro-carmin to the colour normal blood would give with a certain dilution; the other is graduated to 100 divisions, so that when 20 cubic millimetres of healthy blood are diluted 100 times, the tint in the two tubes is the same. A few drops of water are put in this graduated tube, then 20 cm. of blood measured by the pipette provided are added, and the mixture is diluted with water until the colour in the two tubes is the same. A background of white paper is desirable in judging of the colours, or the tubes may be held at the level of the eye between it and the light. In

my experience, 100 per cent. of HbO is never given by healthy blood with these tubes, and as an absolute standard it is not reliable, but for consecutive observations by the same person it serves very well.

Perhaps the chief indication in diagnosis from observation on hæmoglobin is that in chlorosis, and in most secondary anæmias, as from nephritis, cancer, tubercle, syphilis, lead poisoning, &c., the amount is reduced more than the red cells, *i.e.*, each red cell is poor in hæmoglobin, while in pernicious anæmia the number of red cells is reduced more than the hæmoglobin, *i.e.*, each cell is rich in the pigment. Speaking generally and from the point of view of clinical work, it may be said that as the hæmoglobin rises in ordinary anæmias the red-cells increase in number, and so, bearing this in mind, the labour of a blood-count may sometimes be saved.

ENUMERATION OF THE CORPUSCLES.

The best apparatus for counting the corpuscles of the blood is the hæmocytometer of Thoma-Zeiss, the price of which is about 30s. It consists of a pipette for diluting the blood 100 times or 200 times, and a slide ruled in very small squares for counting the corpuscles with the microscope. The pipette consists of a capillary tube opening into a glass bulb. Blood is drawn up the tube to the level of a mark on its stem, then a diluting fluid (nothing more is necessary for the purpose than normal salt solution, which may be tinted with methyl violet) is sucked up into the bulb at the end of the tube to a mark on the tube above it and the blood and fluid are mixed by shaking a glass bead about in the bulb. A drop of the mixture diluted 100 times, or, if rich blood, 200 times, is now placed on the slide.

The slide consists of a central disc bearing the rulings which is surrounded by a rampart of glass at a little higher level (1-10th mm.) so that when the cover is applied a definite depth of fluid is obtained, and a definite area is marked out by the squares, each being 1-400th m.m. The squares are focussed, using a $\frac{1}{4}$ in. or $\frac{1}{8}$ in. objective, and the corpuscles will be seen lying on them as in this diagram, or under the microscope on the table. I do not think it necessary to trouble you with details of the technique. They are quite simple, and readily become automatic with a little practice.

The number of red cells in, say, 50 or 100 squares is counted, and the average taken. Then the following calculation is made: The space above each square is 1-4,000 c.m., and the blood has been diluted 100 times; so, supposing the average number of red cells in a square is 12, the 12 multiplied by 4,000 would give the number of corpuscles in a c.m. of diluted blood, *i.e.*, 48,000, and this, multiplied by 100 (the dilution), *viz.*, 4,800,000, the number in a c.m. of undiluted blood.

The same principle may be used for the white blood corpuscles, though, as they are so much less numerous, a wider bore pipette with a smaller bulb is often used to give a dilution of only 10 times (the necessary calculation being made at the end), but in that case some fluid must be used to dissolve the red cells (which would otherwise obscure the lines) and leave the white; such a fluid is a 0.3 per cent. solution of glacial acetic acid suitably tinted. As a rule, however, in clinical work, both red and white cells are counted with the aid of the red pipette, a dilution of 1 in 100—and a device is used of making a field of the microscope correspond, say, with 50 squares (this can be done by lengthening or shortening the draw tube), and then counting the leucocytes in groups of 50 squares at a time—so many in each field.

An excess of red blood corpuscles is met with in congenital heart disease, in certain cases with chronic cyanosis, rising to 8,000,000, 9,000,000, 10,000,000, or even 12,000,000, in persons living at high altitudes, and in the newly-born. A diminution in their number is met with in anæmias of all kinds, and in pernicious anæmia may fall to 500,000, or even 250,000, and 100,000 has been recorded. In chlorosis the number

of red cells is not much diminished—to 4,000,000, it may be; in leukæmia perhaps to 3,000,000; after infectious fevers, in late tuberculosis, in syphilis, perhaps to 2,500,000. The fall in post-hæmorrhagic anæmia depends, of course, on the amount of blood lost; but recovery is fairly rapid, as the accompanying tables will indicate.

The number of leucocytes may be increased normally as in the new born, during digestion, in pregnancy, and after muscular exercise; it may be increased in many pathological conditions, of which leukæmia is the most striking, but a definite increase is seen in most acute infectious diseases—in pneumonia, erysipelas, diphtheria, ulcerative endocarditis, but diminished in typhoid and influenza, among other diseases, and not altered in tuberculosis. There is a leucocytosis in appendicitis, especially if suppuration be present, thus differentiating it from typhoid. There is usually a leucocytosis in cancerous and other cachexias.

DRIED AND STAINED SPECIMENS OF BLOOD.

The method of staining thin layers of blood for microscopic examination is especially directed to the differentiation of the varieties of leucocytes—a differentiation which leads to important clinical conclusions—and this differentiation can only be satisfactorily made by examining their nuclei (which are only visible when stained) and the staining reactions of their protoplasm. This method is probably the most important of all in such blood examination as we are considering.

A small drop of blood is allowed to diffuse itself between two clean coverslips placed face to face; these are then slid apart, leaving a thin film on each. By waving them in the air, they are rapidly dried, and are then ready for fixing before staining.

The ordinary fixing agents are heat, either by means of a moderately heated oven, 110° C. for an hour, or 150° for five minutes, or passing the films rapidly through a flame five or six times; a mixture of absolute alcohol and ether in equal parts in which they are immersed for half an hour or longer; or immersion in a mixture of one part formalin with nine of absolute alcohol for half a minute, after which they must be thoroughly washed in water.

But the method of fixing I intend to recommend to you is accomplished at the same time that the films are stained by the staining-method I intend to advise you to adopt, the fixing is accomplished by the alcohol in the staining fluid.

There are many methods of staining blood films, but that which I have come to consider as the most reliable, rapid, simple, and efficient—in other words the most suitable for our purposes—is by Jenner's stain. It is an alcoholic solution of a compound of eosine with methylene blue. It is to be bought ready made, either from Grubler's stains, or preferably, I think, in Grubler's original bottles in the liquid form.

Blood stains are divisible into two kinds—acid (in which the acid radicle of its constituent salt is the staining part) such as picric acid or eosine, and basic (in which the basic radicle is the active part) such as methylene blue. Speaking generally, the acid stains (as eosine) stain the protoplasm especially, and the basic stains (as methylene blue) stain the nuclei especially.

So with Jenner's stain the red blood corpuscles are stained red with eosine, and the nuclei of the leucocytes blue with methylene blue. The method for using this stain is as follows:—The dried films are covered with the stain and left for five minutes or so. It is poured off, and they are washed in distilled water, dried, and mounted in cedar oil or balsam. I may say that at a pinch you may use some methyl blue from the stain available for tubercle bacilli, and the eosine from the nearest red ink.

VARIETIES OF LEUCOCYTES.

The main object of staining blood, as I have said, is to differentiate the leucocytes, and to recognise the presence of abnormal cells. What, then, are the varieties of leucocytes in normal blood? Speaking

roughly, they are two—lymphocytes, with hyaline protoplasm and a single nucleus, and granulocytes, with granular protoplasm and a multiform nucleus—called the polymorphonuclear leucocytes. But each of these is divisible into three varieties, hyaline cells into whether they are small or large lymphocytes or having a lobed nucleus—transitional leucocytes. The idea being that the latter form a transitional stage between the cells with a single round nucleus and the multiform nucleus of the granulocyte. The granular cells are divided into those whose granules stain with acid dyes—oxyphile or eosinophile leucocytes, those with basic dyes—basophile leucocytes or mast cells, and those that colour with both—neutrophile leucocytes.

The non-granular or hyaline leucocytes are, therefore, three—the lymphocytes proper—the small mononuclear leucocytes, the large mono-nuclear leucocytes, and the transitional leucocytes.

The lymphocytes are a little smaller than the red blood corpuscle; both nucleus, which is round and nearly fills the cell, and the mere rim of hyaline protoplasm stain blue with methylene blue, the protoplasm more deeply than the nucleus; the nucleus has a nucleolus and a fine intranuclear network. In healthy adults they vary between 20 and 30 per cent. of all the leucocytes.

The large mononuclear leucocyte is two or three times as large as the red cell, the protoplasm is relatively more abundant in proportion to the nucleus—otherwise their characters resemble those of the lymphocyte.

The transitional leucocyte resembles the large mononuclear leucocyte in every way except that its nucleus is lobed. It represents an older stage of this mononuclear hyaline cell, and was believed, probably erroneously, to develop into the polymorphonuclear leucocyte. These two latter forms taken together vary in normal blood between 4 and 8 per cent.

The polymorphonuclear leucocytes are a little smaller than the large mononuclear. They are readily recognised in films stained with nuclear stains

by the appearance of the nucleus. This consists of several masses scattered throughout the cell at first sight detached, but really connected with fine strands of nuclear substance, the whole like a sparse string of beads, being twisted on itself in the form of S or Z or Y or E. The protoplasm stains with acid dyes, *i.e.*, faintly pink with eosine, but the granules embedded in it vary in different cells in their colour reaction. In the first group they are fine, numerous, and stain a purplish pink with Jenner's stain; these are the neutrophile polymorphonuclear leucocytes. In the second group, the granules are larger, not so densely crowded, and stain a bright deep pink with eosine; these are the eosinophile polymorphonuclears. The third group have large and still fewer granules which stain blue with Jenner's stain, these are the basophile polymorphonuclears, or the mast cells of the Germans.

The neutrophiles are the phagocytes proper, and are actively amoeboid; they are the most numerous of all the leucocytes in normal blood, varying from 60 to 80 per cent. The eosinophiles occur in from 1 to 5 per cent., and the mast cells from about 0.5 to 2 per cent.

ABNORMAL CELLULAR ELEMENTS.

The abnormal cells which are important from a diagnostic point of view are two—first, a large mononuclear white cell—possibly the predecessor of the polynuclear leucocytes, normally found only in the bone marrow. These are called *myelocytes*. They are as large or a little larger than the polynuclear leucocytes have a large round faintly blue staining nucleus, and granules either neutrophilic, eosinophilic, or basophilic.

The second abnormal cell is a *nucleated red cell*, the predecessor of the red blood corpuscle. In foetal life, as in adult amphibia, birds, and reptiles, all the red cells are nucleated; but in healthy extra-uterine life they only occur in organs where blood formation is progressing, in the spleen in early extra-uterine life, and in the bone marrow in later life. But when stress of blood formation becomes great, the original nucleated forms escape in smaller or large numbers from the blood-forming organs into the general circulation. They are

NORMAL CELL ELEMENTS.

HYALINE CELLS.		Red blood corpuscle.
		Small Mononuclear Leucocyte (Lymphocyte). 20 to 30 per cent.
		Large Mononuclear Leucocyte. 4 to 8 per cent.
		Transitional Leucocyte.
GRANULAR CELLS (Granulocytes.)		Neutrophile Polymorphonuclear Leucocyte. 62 to 70 per cent.
		Eosinophile Polymorphonuclear Leucocyte. 0.5 to 5 per cent.
		Basophile Polymorphonuclear Leucocyte. 0.25 to 2 per cent.

ABNORMAL CELL ELEMENTS.

NUCLEATED RED CELLS.		Microblasts.

		Megaloblasts.
MYELOCYTES.		{ Neutrophile. Eosinophile. Basophile.
		Poikilocytes.

of three sizes—smaller than the red cell microblasts, the size of a red corpuscle normoblasts; and others two or three times larger—megaloblasts. The protoplasm is hyaline, yellow from hæmoglobin, and stains red with eosine like the ordinary red cell. The nucleus is round, has a coarse intranuclear network of even mesh, and no nucleolus, thus helping to distinguish it from the lymphocyte. Sometimes in the older cells, the nucleus stains so deeply with methyl blue that the network is not visible.

CLINICAL SIGNIFICANCE OF CORPUSCULAR VARIATIONS.

These, then, are normal and abnormal cellular elements of the blood. What is the clinical significance of variation from the normal. A few words about each variety must suffice. To begin with the last first—nucleated red cells—when the call on blood formation, as in any severe anæmia, is great the normoblasts appear in the blood; they occur in pernicious anæmia and in larger numbers still in spleno-medullary leukaemia; if the stress is very great indeed, as in pernicious anæmia, megaloblasts appear, and hence they are considered to be of grave prognostic import.

Myelocytes occur in and form an important point in the diagnosis of spleno-medullary leukaemia. Mast cells are increased in chronic spleno-medullary leukaemia, and may be more numerous even than the largely increased eosinophiles.

Eosinophile leucocytes are increased not only in this variety of leukaemia but in the paroxysmal stage of asthma, in presence of intestinal parasites and trichinosis in various skin diseases, and in malignant disease; they are diminished in septic conditions and in acute infectious diseases.

Neutrophile polynuclear leucocytes form the leucocytosis, to which reference has already been made, of acute infectious diseases, in that of digestion, pregnancy, and in septic conditions. But they are unaffected or diminished in typhoid, measles, and influenza, and in tubercle, unless suppuration or complications have occurred.

Lymphocytosis is seen in a few conditions, such as whooping cough and the gastro-intestinal diseases of infancy; but the condition in which it is of the first diagnostic import is lymphatic leukaemia.

The usual method of making a *differential leucocyte count* is to place each leucocyte recognised in a film under its proper heading in a column, add each column up separately, and all the columns together, and express each sort as a percentage of the whole.

For rapid clinical work, I would, in conclusion, suggest the following routine: Examine a plain preparation, estimate the hæmoglobin by Tallquist or Gower's apparatus, make a blood count with the Thoma-Zeiss instrument, and make films, staining them with Jenner's stain. I would also suggest that the examination of the blood, both in physiological conditions and in pathological states of all kinds, is thoroughly suitable as a basis for original work even in active general practice.

NOTE.—A *Clinical Lecture* by a well-known teacher appears in each number of this journal. The lecture for next week's issue will be by Professor Louis Regis, M.D., of the Faculty of Medicine of Paris, on "The Value of Philipowicz," and Bernard's Signs in the Diagnosis of Typhoid Fever."

ORIGINAL PAPERS.

COCAINISATION OF THE SPINAL CORD.

By ROBERT JONES, F.R.C.S.E.

Surgeon, the Royal Northern Hospital, Liverpool, and the Liverpool Country Hospital for Children.

SPINAL cocaineisation has been known among foreign surgeons as having distinct claims, yet little is heard of it from our own people. It is because I believe that its employment is more often indicated than English

surgeons seem to recognise, that I venture to draw attention to two typical cases where its use proved of value.

A working man, æt. about 30, was sent to me by Dr. Marsh, of Atherton. He had been a wilful, obstinate patient, who, in spite of every care on the part of his doctor, presented a mal-united fracture of the lower third of the tibia and fibula. His foot was everted, and the lower fragments, in addition, were displaced backwards. I explained to him it was necessary to excise bone and wire fragments, and to this he at once consented. He was a big person, and as soon as he had taken two or three whiffs of chloroform he jumped off the table and scampered down the corridor and back to bed. Persuasive methods were unavailing, and nature had so endowed him that we felt forcible methods had best be kept in abeyance. There was nothing left us but to dismiss him and to forget him. A fortnight later, his promises had been so alluring, we readmitted him, and we underwent precisely the same experience as before, and a second time he left the hospital. I explained to Dr. Marsh how impossible he was, but I promised to take him in a third time, and on this occasion determined to cocaineise his cerebro-spinal fluid. He submitted to this without protest. A fifth of a grain was injected between the third and fourth lumbar vertebrae, and in ten minutes all sensation left him to well above his umbilicus. He was an old poacher, and while I was operating he poured into the ears of Mr. Littler Jones anecdotes relating to his art. He exhibited no signs of pallor and nausea, and the only interest he took in the operation happened when I was chiselling through very hard callus. He then asked, "What is that knocking?" He took a good meal when he went back to the ward, had no untoward symptom, and made an uneventful recovery.

The second case I present to you is that of a man, æt. nearly 60, who had always led an active life, but had for some years been crippled by a disorganised tuberculous hip. I saw him with Dr. Warburton, and found his condition truly deplorable. He had fallen on his already diseased and painful joint. It was flexed to a right angle, tense, glazed, adducted, exquisitely sore. A footstep on the floor, the closing of a door, a cough, were followed by intense suffering. A splint he had always refused to wear. We removed him in a few days to a little ward in the hospital, where he arrived much exhausted and distressed. We then found that, in addition to an abscess deep-seated, he had cavities in his lungs. The problem we put to ourselves was this—Are we justified in excising a hip in an exhausted patient with a pulse of 130 and cavities in his lungs, so that, should he survive the shock, he might wear a splint with comfort, and end his days comparatively free from pain? Our decision was made easy by the patient, who pleaded that death would be a grateful release from so much suffering. We decided to operate, and Mr. Moore Alexander proceeded to administer chloroform. Only a few whiffs, had been taken when the patient's face became blue, his pulse disappeared, and his extremities became cold. We thought he would die on the table, and he was hurriedly removed to the ward. The anæsthetic produced considerable shock, and for some days serious reaction occurred in the lungs. We decided on the next occasion to cocaineise the spine. His pulse was 140, and we sterilised very carefully the spine, using specially prepared hermetically-sealed aseptic cocaine solution for injection. In from five to ten minutes his hip could be moved without pain and he was carried into the theatre. A screen was placed in front of him and the operation was proceeded with. Very rapidly a long incision was made, a large abscess of fetid pus evacuated, the head of the femur removed, and the acetabulum scraped. When the femur was being sawn the patient said, "I know he is doing something to me now, for I feel my body shaking." Dr. Stenhouse Williams told me at the end of the operation that the pulse was steadier and better than when we started.

The patient did not suffer appreciably from shock, his only discomfort being nausea, which lasted some hours. Several weeks have elapsed since the operation, and the patient has lived a life he can bear with comfort, and he complains but little of his hip.

I have chosen these two cases as types in support of the undoubted value of this form of anæsthetic. In one case the patient would not take chloroform, in the other he couldn't. Cocaine in each instance answered admirably. Cases of this kind are common, and we have all met with many people who forego very necessary surgical procedures because they refuse a general anæsthetic. A few words regarding the history and status of spinal cocainisation may not, therefore, be out of place.

It was first suggested and tried by Corning, of Chicago, but Bier and Leldswitsch were pioneers on the Continent, and Tuffier of Paris, a most trustworthy surgeon, used it as a routine anæsthetic. It is perhaps this use of it as a routine anæsthetic which has prevented English surgeons from doing justice to its usefulness. The consensus of opinions abroad is adverse to any attempt at substituting cocaine for ether and chloroform. About eleven deaths have occurred in about 3,000 cases, all of which seem to be due to toxic poisoning. If for no other reason, this should negative its routine employment. Some surgeons, like Tuffier, have been remarkably free from catastrophe. When I heard last, he had operated upon over 300 under cocaine, with only one death, which might reasonably be ascribed to the drug. Morton—who, like Tuffier, is remarkably good in his technique—out of 253 cases had only seen alarming symptoms in one case, and in that case a quantity of cerebro-spinal fluid had been removed for investigation. Stone, out of 441 cases, met with only one death; and I merely mention these statistics in support of the argument that even if cocaine cannot compete with ether or chloroform as a routine anæsthetic, it is sufficiently safe to be used as an occasional substitute in suitable cases. Obviously, for its safe practice, an irreproachable technique is demanded. The patient's skin should be scrupulously clean. The cocaine solution must be sterile. The glass syringe should be boiled and placed in sterile water. The needle should be introduced between the third and fourth or fourth and fifth lumbar vertebræ. It should be sufficiently long, fine, and not too acutely pointed. The patient should be made to stoop, and the needle should be introduced very slowly and in stages, in order to give the cerebro-spinal fluid time to escape. This is a most important point, otherwise it is easy to traverse the canal. No injection must, under any condition, take place until fluid escapes through the needle. Causes of failure in reaching the canal are easily avoidable. They may arise from the needle impinging on the lamina, from failure of the eye to enter the canal, from a clot of blood or tissue, or from traversing the canal. If the needle does not reach the subarachnoid space it should be withdrawn and re-applied. It is a mistake only partially to withdraw it. Thirty minims of a 2 per cent. solution should be a maximum dose. The cocaine should be introduced very slowly. Some surgeons advocate receiving the abstracted cerebro-spinal fluid in a sterile glass containing one grain of the drug, and re-introducing it into the subarachnoid space. The needle is withdrawn and the puncture sealed. When the injection has been completed the patient should feel a sense of warmth through his body, thirst, which comes on in about five minutes, and a certain amount of nausea, which lasts about ten or twenty minutes. If the patient attempts to walk, some inco-ordination is present; his sense of contact is not affected, but the reflexes are slightly diminished. Intestinal peristalsis and uterine contractions are stimulated. When first administered there is an increase of pulse, and sometimes pallor, perspiration, and vomiting, while sometimes the sphincter action of the vagina, rectum, and bladder are abolished.

Analgesia usually begins in the feet, and ascends

slowly in from three to ten minutes, until it generally ends well above the xiphoid. There is often noted an abnormal loquacity. The analgesia usually lasts for over an hour, sometimes for two or three. The fatal cases have been generally due to direct toxic effects.

In order to convey a general idea of the frequency of annoying symptoms. I will quote Morton's analysis of 253 cases. The ages of the cases operated upon ranged from 8 to 86; many of the patients suffered from organic diseases of heart, kidneys, and lungs.

Of 553 cases, nausea was present in 65; vomiting, 53; headache, 37; involuntary evacuation, 9; post-operative chill, 6.

One other not unusual symptom I will refer to, and that is a post-operative rise of temperature, ranging from 99° to 103°.

For tropa-cocaine, of which I have no experience, it is claimed that the effects are not nearly as toxic, and are recovered from more quickly, and that thirst, heat, vomiting, and perspiration seldom follow; against this, some observers complain that its effects are not sufficiently constant to warrant its substitution for cocaine. Guinard, however, by employing cerebro-spinal fluid as a medium, has given seventy administrations of tropa-cocaine without an unpleasant symptom. It is very necessary, however, to place cotton-wool in the ears, and place a screen before the patient, to deaden him to his environment. Many symptoms may be due to fear: as Rodman says, discussing pallor, "no one can look at his own blood flowing without misgiving and apprehension."

What are the contra-indications. On this point opinions differ very much. From the point of view of danger, Tuffier warns us against giving it to the hysterical and to children. Others with less experience proscribe senile degenerations and renal affections. Morton, with his 253 cases, says there are no contra-indications, although he does not advocate its routine use. I suspect that until the dose is administered, nobody can tell the nervous system to which cocaine is a poison. In doubtful cases I would suggest that a very small subcutaneous dose might solve the problem as to immunity.

Tuffier, although he has performed 200 intra-abdominal operations, six of them being gastro-enterostomies under cocainisation, thinks the operator may be somewhat handicapped by rigidity of muscle and occasional vomiting, and it seems generally conceded that the drug is best suited to those instances where operations are performed for herniæ, for bladder affections, and for serious operations on the limbs.

My feeling is that spinal cocainisation has come to us to stay; that with careful aseptic precautions the risks are but small. Its indications point towards—

1st. Patients not suited for general anæsthetics, such as in those suffering from advanced phthisis, and from respiratory affections like bronchitis and asthma.

2nd. Towards people who have a fatal objection to taking an anæsthetic, and on whom an operation is urgently needed.

3rd. Towards those suffering from great shock, due to severe injuries of the lower limbs.

With caution in its employment and the careful selection of cases, surgery has much to gain from spinal cocainisation.

A SERIES OF FIFTY CONSECUTIVE ABDOMINAL SECTIONS.*

By R. P. RANKEN LYLE, M.D. DUR.,

Obstetric Physician to the Newcastle Lying-in Hospital, &c.

IN December, 1902, the Samaritan Hospital was instituted in Newcastle-upon-Tyne for the practice of gynecology. There are six beds, including one emergency bed, for patients and an out-patient department, which is open two days a week. All the operations are performed in an ordinary attic under the most restricted conditions, and it has not been specially fitted up in

* Paper read at the meeting of the British Gynecological Society June 14th, 1906.

any way. Since its opening I have performed a very large number of major and minor operations, and I now have the honour of placing before you the result of the first fifty abdominal sections, and of drawing certain conclusions therefrom.

The date during which this series of operations was performed extends from October 1st, 1903, to January 18th, 1906, and they were performed for the following conditions:—

Ovarian cystomata, including dermoids	18
Fibro-myomata of the uterus	11
Ectopic gestation	6
Broad ligament cyst	3
Adherent retroversion	3
Pyosalpinx	3
Tuberculous disease of the peritoneum	2
Malignant disease of the cervix uteri	2
General abdominal carcinosis	1
Parovarian cyst	1
	—
	50

The following is a list of the operations performed:—

Ovariectomy	17
Supra-vaginal hysterectomy	8
Salpingectomy	5
Salpingo-oophorectomy	4
Enucleation of cyst	4
Cœliotomy	4
Myomectomy	3
Ventro-fixation	3
Panhysterectomy	2

I have unfortunately to record one death. The case will be fully described. The technique adopted in all these operations was of the simplest nature, as I am of opinion that complicated technique or elaborate preparations are not only unnecessary but may be even a source of danger to the patient, inasmuch as minor essentials may be sometimes accidentally overlooked when the preparations are too elaborate.

Antisepsis was very carefully carried out, the hands and forearms were thoroughly washed in hot lysol solution with a nail brush, then turpentine and methylated spirit were used and the hands and forearms well washed in 1 in 1,000 corrosive solution. The instruments were boiled and placed in 1 in 40 carbolic solution. The sponges which were of gauze, were boiled for 20 minutes, and were then wrung out of hot saline. All buried ligatures were of catgut, which was prepared by ether, methylated spirit and corrosive sublimate solution. Silkworm gut was used for all superficial sutures. The abdomen was prepared the night previous by washing with soap and water, then sponged with turpentine and methylated spirit, and the application of a corrosive pad over night, and washed with 1 in 1,000 corrosive sublimate solution just previous to the operation. No vaginal antisepsis was carried out even in cases of panhysterectomy. The abdominal incision was restricted to the smallest dimensions consistent with the proper performance of the operation, and there was consequently a marked absence of shock following the operation, and a diminished risk of ventral hernia in later years. All cut surfaces of peritoneum were properly adjusted, such as suturing the anterior and posterior layers of the peritoneum after hysterectomy and the removal of broad ligament cysts, and suturing the peritoneum over the pedicle in cases of ovariectomy and salpingectomy.

The abdominal wall was carefully sewn up in three and sometimes four layers, care always being taken to properly adjust corresponding structures. A small strip of plain sterilised gauze, wrung out of hot saline and covered with plain absorbent wool, was used as a dressing to the wound. The dressing was kept in position by strapping and flannel bandages. Ether, with one or two exceptions, was the anæsthetic. In three cases of pyosalpinx in which a small amount of purulent material escaped during the operation, it was carefully mopped up and did not cause any further trouble. In those cases where a large raw surface of peritoneum occurred—e.g., ventral fixation for adherent

retroversion, as much saline solution as possible was left in the abdomen, to float the intestines from the wounded surface and so prevent adhesions.

After Treatment.—The patient was given a drink of hot water with a little bicarbonate of soda in it (which is often effectual in relieving bilious vomiting) about three hours after the operation. This was freely continued in addition to barley water until the following morning, when she was given a cup of tea, followed during the day by milk diluted with barley or soda water. Early on the second morning after operation, calomel was given in two doses of five and three grains respectively, at an interval of one hour, followed by a hot seidlitz drink, half an hour later. As soon as the bowels were moved the patient was put on a liberal diet. The sutures were removed on the tenth day.

OVARIAN CYSTOMATA.

There were eighteen cases as follows:—

	Cases.
Simple unilocular	6
Multilocular simple	4
Multilocular undergoing colloid degeneration ..	3
Multilocular suppurative	1
Multilocular malignant	1
Multilocular papillomatous	1
Dermoids	2

In addition to these a case of left tuberculous pyosalpinx was found complicated with a right ovarian cyst the size of a goose egg, and a case of cervical fibro-myoma had a cystoma of each ovary. The following cases were of special interest:—

CASE 7.—Suppurating multilocular ovarian cyst with purulent peritonitis. This patient was exceedingly ill, having had a temperature of 104° F. for two evenings before the operation. On opening the abdomen the peritoneum was very inflamed and œdematous and the omentum was adherent to the tumour, which was about the size of a seven months' gestation. On separating the omentum several ounces of encapsuled pus escaped, the tumour was removed, the posterior vaginal fornix was opened and a gauze drain was inserted through it into the pelvis. The temperature fell to 97° F. on the morning after the operation, but was 105° F. the following evening; after a great deal of fluctuation it gradually fell to normal six weeks later, when she was discharged. Some days after leaving the hospital she had a relapse, and unfortunately died a fortnight later.

CASE 26.—Ovarian dermoid with twisted pedicle. The twist occurred about one week before admission, when there were the usual symptoms of peritonitis. On opening the abdomen the tumour was found partly gangrenous. She made an uninterrupted recovery.

CASE 42.—Malignant ovarian cyst. The whole of the peritoneum and omentum was infiltrated with hard malignant masses, and the tumour was found adherent in all directions and commencing to disintegrate. It was not removed, but the abdominal cavity was filled with saline solution and then closed. Convalescence, as far as the operation was concerned, was uneventful.

CASE 44.—Enormous multilocular ovarian cyst undergoing colloid degeneration: This patient was confined nine weeks previously of a seven months' child, since that time the abdomen rapidly enlarged, and on admission was about three times the size of a full term gestation. She was very emaciated and very ill, pulse 120, very feeble and temperature 99° F. She had severe dyspnœa, and was unable to lie down during the whole night before operation. The patient had to lie on her left side on the operating table, as respiration ceased when she was turned on her back. The abdomen was opened with her on her left side, and about two gallons of ascitic fluid escaped. The tumour, which was about 1½ times the size of a pregnant uterus, was adherent to the under surface of the liver and diaphragm. The pedicle was clamped and divided and the tumour removed from below upwards. The other ovary was about the size of an ostrich's egg. It was also removed, and the abdomen filled with about 1½ gallons of normal saline. During the greater part of

the operation the patient was practically pulseless, and respiration temporarily ceased on two occasions, the anæsthetic (ether) was not pressed, and during the closing of the abdomen she was partly conscious. She got three injections of 1-20th of a grain of strychnine. When returned to bed the pulse was just perceptible at 180, shortly afterwards it fell to 160, and in the evening it was 140. She made a good recovery, and six months later was reported to be in good health.

CASE 45.—Right ovarian cyst: In addition this patient had a left ovarian abscess which contained four or five ounces of very fetid yellow pus, and a double hydrosalpinx. She made an uninterrupted recovery.

FIBRO-MYOMATA.

Eleven operations were performed for the removal of fibromyomata, and in every case the symptoms complained of by the patient were sufficient to render the operation one of necessity. Supravaginal amputation of the uterus was performed in eight cases, and myomectomy in three. Myomectomy was the operation of selection, but in those cases where it was not feasible, supravaginal hysterectomy was performed, care being always taken to leave the ovaries, in order to save the patient from the ordinary consequences of their removal prior to the menopause. An artificial menopause practically means that the patient will be an invalid for many months, and it is highly desirable that this, if possible, should be prevented. It was not possible, however, to leave the ovaries in Case 47, as there was a cystoma of each ovary. The following cases are of interest:—

CASE 3.—Myomatous uterus and large ventral hernia. Death: This patient was operated on eight years previously, the ovaries being removed in the hope of curing her. The result, however, was that she continued bleeding, making her a chronic invalid, besides the tumour increased in size and she developed a very large ventral hernia, which reached to her knees and totally incapacitated her from work. She was very corpulent and anæmic. The abdomen was opened by an elliptical incision extending from the umbilicus to the pubis and surrounding the hernial sac, which contained nearly all the intestines. They were entirely adherent to the hernial ring which was four inches long by three broad. The intestines were separated from the ring which was dissected out. On examining the pelvis everything was found adherent, a myomatous uterus the size of a large coconut was freed from its adhesions and lifted out of the pelvis, the broad ligaments ligatured and divided, and the tumour removed, the cervix being left. The peritoneum was sutured over the stump. With some difficulty the intestines were returned into the abdomen and the abdominal wall sutured in four layers with strong catgut. She developed a small fæcal fistula in the lower angle of the wound which practically ceased discharging on the seventh day. During the next two days her condition was very satisfactory, but on the morning of the tenth day at 2 a.m., she was suddenly awakened with severe pain in the region of her heart, and much difficulty in respiration. She was deeply cyanosed, pulse very rapid, irregular and feeble. She was given stimulants internally, with strychnine and digitaline hypodermically. Considerable improvement took place till 6 a.m., when she had a similar attack, and died in ten minutes, death being due to pulmonary embolism, probably fat embolism.

CASE 32.—Myomatous uterus, supravaginal hysterectomy. The tumour was the size of a foetal head and impacted in the pelvis, causing partial intestinal obstruction: Patient had purulent cystitis, and was seriously ill. On opening the abdomen the bowels and omentum were found adherent all over the front of the tumour. These were separated and both tubes were found distended with pus. While removing them they both burst and some pus escaped. This was carefully mopped up. The myomatous uterus was removed and the abdomen closed. The patient made an uninterrupted recovery.

CASE 43.—Subserous fibro-myoma—myomectomy:

This patient was five months pregnant, and suffered severe pain on the left side of the abdomen. The abdomen was opened at the left border of the rectus, and a pedunculated myoma the size of a large goose egg was found in the left iliac fossa, and was removed from the surface of the pregnant uterus. The uterus then rotated from left to right through a quarter of a circle, so that the point of attachment came to lie in the middle line anteriorly. The patient went on to full term and had a normal confinement.

ECTOPIC GESTATION.

There were six cases of ectopic gestation. Case 17 was admitted on August 2nd, 1904. Rupture took place at 4 p.m. the following afternoon as she was lying quietly in bed. The patient rapidly became collapsed, but fortunately before an hour was passed I was able to proceed with the operation, which was in no way difficult. The abdomen was full of recent blood-clot, this was not removed. All these six cases made uninterrupted recoveries.

BROAD LIGAMENT CYST.

There were three cases, none of them presented any difficulty. The cysts were opened, the capsules enucleated, and the wounds in the broad ligaments sutured with fine catgut. They all did well.

PYOSALPINX.

In addition to the case which was associated with a myomatous uterus, and which is already described, there were three cases. One of these, Case 34, was tuberculous. It was single and was associated with an ovarian cyst of the opposite side. The pyosalpinx was matted with some knuckles of intestine, which were involved in the disease, and during its removal, the bowel unfortunately got injured. This was carefully and with some difficulty sutured. A strip of plain sterilised gauze was inserted from the wound in the bowel to the lower end of the abdominal incision to determine the track of a fæcal fistula, should such occur. The following day the gauze was removed, and two days later a small amount of fæces came through the lower angle of the wound. This continued for six days, then ceased and the fistula completely closed. With this exception, convalescence was quite uneventful.

CASE 28.—Double pyosalpinx of old standing: On opening the abdomen the intestines were found matted, with old and dense adhesions, over the tumour. They were separated with much difficulty, and during the removal of the tumours, one of them burst and a quantity of pus escaped, this was very carefully mopped up, and the abdomen closed without the insertion of any gauze for drainage. Three days later some discharge which had a fæcal odour, came through the lower angle of the wound. This continued for five days when the fistula closed spontaneously leaving a hollow granulating surface about two inches square. Three silk-worm gut sutures were inserted, pulling the granulating surfaces together, the wound healed perfectly and the patient did well.

ADVANCED MALIGNANT DISEASE OF THE CERVIX.

Panhysterectomy was performed in two such cases, in order to relieve severe symptoms of hæmorrhage and pain. Both patients recovered, although one of them developed a temperature, which, on one occasion, was as high as 102.6° F. The temperature, however, remained perfectly normal for nine days before she was discharged from the hospital.

DRAINAGE.

Gauze was used in three of the earlier cases—Nos. 5, 7, and 12—for the supposed purpose of drainage, but the result was unsatisfactory. In Case 5, panhysterectomy for ulcerating malignant disease of the cervix, gauze was used from the pelvis into the vagina, and the result was a gradual rise of temperature to 102.6° F., whereas in a similar case (Case 46), no gauze was used, and the patient made an uninterrupted recovery. In the case of the suppurating multilocular ovarian cyst (Case 7), the posterior vaginal fornix was opened and the pelvis drained through the vagina. The result was a pelvic abscess which had to be douched

for many days afterwards, and to which I have little doubt her high temperature and unsatisfactory convalescence was partly, if not mainly, due.

In Case 12 gauze was also used for the supposed purpose of drainage, on account of general oozing, and although this patient had a normal convalescence four weeks after the operation, a fæcal fistula developed during the fifth week.

I have since then altogether abandoned the use of gauze for drainage purposes in abdominal and pelvic work, unless in cases of pelvic abscess, where the abscess wall cannot be removed, and have since followed the following rule. If a little pus accidentally escapes I carefully mop it up and in case a large amount escapes and soils the intestines, I wash the intestines and pelvic cavity thoroughly with normal saline and then close the abdomen, leaving a considerable quantity of saline behind. In cases of general oozing I first secure the more important points, and then fill the pelvis with saline.

I have followed this rule in several such cases on which I have operated since, and the result has been quite satisfactory in every case. I have now no doubt that the gauze in the earlier cases did not act as a drain, but merely as a superfluous and noxious foreign body, and a local irritant to any intestinal surface with which it came in contact.

TEMPERATURE.

	One occasion only.	Two occasions only.	More than two occasions.	Total.
Not exceeding 100° 4 F.	—	—	—	28
100° 5° F to 101° F.	9	3	1	13
101° 1° F to 102° F.	—	5	1	6
102° 1° F to 103° F.	1	1	—	2
Above 103° F.	—	—	1	1

A study of the temperature charts of this series is most interesting, considering the circumstances under which the operations were performed. There was not a single case of "sepsis from without" in the wholeseries. In no less than 41 cases the temperature did not exceed 101° F. even on a single occasion.

In five cases the temperature exceeded 101° F. on two occasions only, but did not exceed 102° F. These cases were—

17. Recent ruptured ectopic with severe internal hæmorrhage.

21. Ovariectomy for simple ovarian cyst.

33. Supravaginal hysterectomy for large myomatous uterus in a very corpulent subject.

44. Double ovariectomy. The abdomen was enormously distended and the patient was extremely ill on admission.

46. Panhysterectomy for ulcerating malignant disease of cervix.

In Case 3, which proved fatal, the temperature was marked between 101° F. and 102° F. on three occasions. Only in two cases was the temperature recorded above 102° F. and less than 103° F. These were:—

5. Panhysterectomy for ulcerating malignant disease of cervix.

48. Advanced malignant disease of the peritoneum. The temperature was due in this case to a somewhat mild attack of left-sided pneumonia at the end of the second week after the operation.

Only in one case was there any serious degree of temperature. This case was one of suppurating multilocular ovarian cyst with purulent peritonitis, but the temperature was 104° F. for two nights prior to the operation.

CONCLUSION.

That the observation of the following points is highly desirable in order to obtain good results.

1. A correct preliminary diagnosis.
2. Simplicity in operative technique.
3. The simplest antiseptic preparations combined with aseptis.
4. The use of few surgical instruments and appliances.
5. Limited abdominal incisions.
6. The correct adjustment of all cut peritoneal surfaces.

7. The complete closure of the abdominal cavity, without drainage of any kind.

8. The free use of normal saline solution in cases where purulent material gets accidentally spilled in the pelvis or abdomen during the performance of an operation.

CLINICAL RECORDS.

NOTE ON CASE OF LARGE PSEUDO-MUCINOUS CYSTOMA.*

By MACNAUGHTON JONES, M.D.

THE patient, æt. 42, has been married two years. Menstruation had ceased in December, 1905. Soon after this she was troubled with vomiting. No internal examination was made, as she objected. A monthly nurse was engaged, who insisted early in May that the patient should see a doctor. On examination it was discovered that she was not pregnant, but thirty-five tumblers of ascitic fluid were drawn off. The day following the patient made a long railway journey to London. When I saw her I found that there was still enormous distension of the abdomen. She was greatly emaciated, and had the extreme type of "facies ovariana." Her weakness was so great that I made no examination, but determined to operate the next morning. She was not in the most favourable condition when placed on the table, and I had some unpleasant doubts as to whether she would survive the operation. The incision reached to a few inches below the umbilicus. I drew from the abdomen a very large quantity of ascitic fluid, disclosing a large tumour which completely filled it. There were comparatively few adhesions. Evidently there had been some escape of the contents before operation into the peritoneal cavity. I tried to take the tumour out entire, and succeeded in doing so with the exception of a small rent posteriorly, made in extraction. The bowel was everywhere highly congested, and in a state of sub-acute inflammation, with adherent flakes of fibrin here and there. The abdomen was freely flushed out with saline solution, and afterwards carefully mopped out with weak formalin.

It is not necessary to refer to the post-operative symptoms. Her condition now is most favourable, and she is gaining flesh, and so far there has been no trouble. Since the operation I have found the spleen somewhat enlarged, and any pain she has had has been referred to this region.

At a recent meeting of the Gynæcological Society I showed a specimen of a semi-solid mucin cystoma associated with ascites, and referred to Professor Schroeder's recent paper on the prognosis of such cases, and the prospects of metastasis occurring and transplantation of the contents in the event of rupture of the cyst.

In the same Society's *Journal* for August, 1905, our editor, Dr. J. J. Macan, gives the most complete summary of the views of Pfannenstiel, Hoffmeir, and those who, like Martin and Olshausen, took part in the discussion at the Kiel Congress of the German Gynæcological Society in June, 1905. That review of this most important subject includes Pfannenstiel's definition of the terms, "malignancy" and "recurrence" as applied to these tumours. He points out that malignancy is not established by the recurrence of the tumour or implantation. Both may occur in the case of a benign tumour. Cystadenoma is the more serious form; sero-cystic tumours, fibroma and dermoids are not so. Between adenomata and carcinomata it is often most difficult to distinguish. Of the pseudo-adenomata the papillary form is the most malignant. Of the pseudo-mucinous tumours over 90 per cent. are permanently cured. In these there is no anatomical malignancy. There is no true metastasis. Cachexia, however, is the result of the growth of large tumours, and has to be considered as a cause of death.

Hoffmeir argues as to the non-malignancy of the

* Read before the British Gynæcological Society, June 14th 1906.

pseudo-mucinous cystadenoma—dermoid and fibroma. Papillary serous cyst adenoma is a less favourable form than the simple serous variety. In all suspicious cases the other ovary should be removed. As in my case, before the menopause the preservation of the second ovary is of importance. "No definite rule can be laid down as to the permanency of cure or the time needed for watching."

Pfannenstiel regards the removal of the second ovary in all cases of doubtful malignancy as *imperative*. We may draw certain conclusions from the general experience of such cases:—

1. The necessity for early interference in ovarian cystoma and the greater urgency for operation when ascites is present to any extent.
2. The removal of the tumour when possible in its entirety without rupture of the cyst wall. This may require an incision from ensiform cartilage to pubes.
3. As little disturbance, contusion, or injury to the peritoneum as possible.
4. In all cases in which there is any escape of the cyst or loose vegetations present, the free washing out of the abdominal cavity with saline solution, and the mopping out of the pelvic cavity, the careful cleansing of any contents of the tumour from the exposed peritoneal and bowel surfaces; for purposes of prognosis microscopic examination of the cyst wall and its contents.
5. In all doubtful cases the removal of the second ovary; its removal in all cases after the menopause.

THE OUT-PATIENTS' ROOM.

METROPOLITAN HOSPITAL.

A Question of Diagnosis.

By LEONARD WILLIAMS, M.D., M.R.C.P.

THIS man, whose age is 48, comes here complaining of pain in the chest of paroxysmal character. He gives a history of having had pleurisy some years ago from which, so far as he knows, he recovered perfectly. The pain in his chest he first noticed soon after the pleurisy, and he has been troubled with it at intervals ever since. Latterly it has become so frequent that he wishes to be examined.

On looking at his chest you see that there is retraction at the fifth and sixth interspaces, and if you put your hand over the heart's apex, you will feel that this retraction is systolic in time. The heart's apex is displaced outwards, but not much. It is displaced downwards to the seventh interspace. The percussion dulness shows no enlargement to the right, but there is pulsation in the epigastric notch. On auscultation there is a loud systolic murmur at the apex and a very decided see-saw murmur at the aortic base; that is, a murmur both of aortic stenosis and aortic regurgitation. He also has a waterhammer pulse. If you palpate the upper part of his chest, you will find a very definite thrill which is transmitted into the carotids. Now, the origin of this thrill presents rather an interesting problem. Thrill may arise from aortic aneurysm, from mitral stenosis, from mitral regurgitation and from aortic stenosis. There is nothing to support the diagnosis of aneurysm in this case. The thrill of mitral stenosis is pre-systolic in time. It is rough and runs into the first sound; it is best appreciated at the apex. This thrill, however, is systolic in time and is best appreciated at the base. It is probably, therefore, not due to mitral stenosis.

The thrill of mitral regurgitation need hardly be considered. It is best appreciated at the apex, and is not a common accompaniment of the condition. The thrill which we are here examining is certainly very much better appreciated at the base than at the apex, and as we have evidence that there is disease at the aortic valve, in that there is definite aortic regurgitation, we are, I think, justified in assuming that this thrill is caused at the aortic rather than at the mitral valve. We have, however, to consider two other causes of thrill. One is aortitis. In aortitis a thrill is often

produced by the passage of the blood over the roughened surface of the arch. It is accompanied by a muffled first sound at the apex and an accentuated second sound at the base, and it is generally attended by an increase in the dulness at the manubrium sterni. These conditions not being present, I think we may exclude aortitis.

The other unconsidered form of thrill is that which may be produced by pericardial adhesions. The thrill in this man's case is felt at the apex and is of a peculiarly superficial character. It is attended by systolic retraction and practically disappears when the patient is in a recumbent posture. Now, this disappearance in the recumbent posture is very suggestive. Murmurs, as you know, which disappear in the recumbent posture are generally regarded as being caused by some influence outside the heart—in the pericardium or elsewhere. And the fact that this thrill disappears, coupled with its very superficial character makes me incline to the belief that, in so far as its apical position is concerned, it is due to adhesions rather than to anything intracardial.

A thrill which is caused by contraction at the aortic valve may, as we know, be transmitted to the apex, or the thrill itself may originate at the apex. You will remember Dr. Gee's aphorism that if you diagnose disease at two valves, you are probably wrong. But the thrill which is to be felt at the apex is not synchronous with the thrill which is to be felt at the base, so that it is obvious that, in this case at any rate, the apical thrill is not transmitted from the aortic opening.

If you put one hand at the aortic cartilage and another over the apex, you will feel that there are in reality two distinct thrills, and I think the probable explanation of the situation is this: This patient has aortic stenosis and aortic regurgitation, the thrill at the base is due to aortic stenosis, and the thrill at the apex is due to some pericardial adhesions which were contracted when he had his pleurisy some years ago, the inflammation of the pleural cavity having extended to the pericardium.

OPERATING THEATRES.

NORTH WEST LONDON HOSPITAL.

NÆVUS OF CHEEK.—MR. MAYO COLLIER operated on a boy, æt. 8, who was the subject of a large nævus on the right cheek. The mother stated that soon after birth she noticed a small dark spot on the inner aspect of the right cheek, not far from the lips. This had slowly increased in size until it had attained its present dimensions: it extended from the right angle of the mouth backwards as far as the right pillar of the fauces—the whole thickness of the cheek was involved; a considerable swelling covered only by thin skin was apparent on the outside, whereas the whole of the mucous membrane on the inner aspect of the cheek was invaded by a dark blue mass of venous tissue. On compression the mass could be made to considerably diminish; on removal of the pressure the tumour resumed its original size. No thrill or pulsation was present, and no previous treatment of any kind had been resorted to. The patient's mother had not even applied for treatment, but the boy having been admitted for a scalp wound was detained by the house surgeon as a case which should be further treated with respect to the nævus. Mr. Collier said this case was one of considerable difficulty; it was a matter of anxiety to know what the best treatment would be to adopt. Running through one's mind the various treatments adopted for the cure of nævi, not one alone would be found efficient on this occasion. [Of electrolysis, excision, cautery, ligature or injection, none here could be resorted to. Electrolysis with a hospital

patient, especially of such tender age and with such an extent of tissue involved, meant a great number of sittings and a large amount of time. Excision was out of the question, as the mass was too extensive and the disfigurement resulting would be worse than the disease. The same objections to the electrolysis would, he said, apply to the cautery as involving too many sittings and too much expenditure of time, and not holding out a promise of a satisfactory result. Ligature as ordinarily applied to *nævi* so as to strangulate the growth was in this case out of the question from the fact that the *nævus* involved the whole thickness of the cheek, and its excision would risk a serious deformity. The possible results of injecting tissues in this position such as slough, thrombosis and abscess did not recommend this method. Mr. Collier said that from the fact that the *nævus* was more apparent on the inner aspect of the cheek and a large number of tortuous veins could here be observed, he thought it would be wiser to attack the growth by stages, and to combine multiple ligature with one of the other methods he had enumerated. Accordingly, the mouth being held well open, he proceeded to pass six ligatures from above downwards with curved needles through the inner aspect of the *nævus*, so as to involve not more than half its thickness. The

first ligature was placed with some difficulty half an inch in front of the anterior pillar of the fauces. The result of perforating the *nævus* in this position was a considerable hæmorrhage, which was only arrested by further ligatures in mucous membrane only. The blood that flowed from the needle punctures was bright red, and was ejected with considerable force, showing that an artery of some size must have communicated with the *nævus*. In order to facilitate the introduction of the other five ligatures contemplated, Mr. Collier, as a preliminary step, tied the facial artery as it passes over the lower jaw. This step rendered the introduction of the other ligatures less difficult, although each and every one was accompanied by considerable hæmorrhage, and stitches had to be placed at the points of entry and exit so as to take up the mucous membrane only. The result of the operation was in the end extremely gratifying. For the first week there was much swelling of the cheek, and slight pain; at the end of three weeks the mass had considerably diminished, was distinctly hard in consistence, and presented little deformity when compared with the other side. No further treatment was resorted to, and the case was exhibited at the British Laryngological Association some six weeks afterwards, when a complete cure had been established.

TRANSACTIONS OF SOCIETIES.

BRITISH GYNÆCOLOGICAL SOCIETY.

MEETING HELD THURSDAY, JUNE 14TH, 1906.
Mr. BOWREMAN JESSETT, President, in the Chair.

DR. MACNAUGHTON JONES showed a large multilocular dermoid cyst of the ovary, removed from a patient, *æt.* 47. She had been a sufferer for twenty years, was extremely feeble, suffering from attacks of tachycardia and syncope. At operation the tumour was found to have filled the entire abdomen, the upper third consisting of a mucin cyst containing five pints of thick gelatinous fluid. This was evacuated, and the remainder of the tumour removed entire. The interesting point connected with the tumour was that the wall was smooth and denuded of hair, but in its section showed degenerate gland tissue and stumps of hair which were being devoured by multinuclear giant cells. In this country attention was first drawn to these giant cells by Mr. Herbert Williamson at a meeting of the Obstetrical Society, in October, 1904, and his conclusions, and those of Pfannenstiel, as regards the differentiation between dermoid cysts of the ovary and those found elsewhere in the body are of interest (*Obs. Trans.*, 1904). The patient had done well.

DR. MACNAUGHTON JONES also showed a large pseudomucinous systema tumour of ovary weighing twelve pounds, which he had removed from a patient, *æt.* 42. Some thirty pints of ascitic fluid were removed, and the patient was reduced to a state of extreme emaciation. The tumour was taken out whole. The patient had made a good recovery, and was gradually regaining flesh and strength. His remarks will be found fully reported under "Clinical Records" in another part of the present issue (see page 687).

THE PRESIDENT remarked that the second specimen was important chiefly in regard to the question of malignancy. The late Mr. Lawson Tait laid it down as an axiom that where there was a large abdominal tumour with ascites the probability was the tumour was malignant. He agreed with this in the majority

of cases. He wished to know why the remaining ovary was not removed, as the patient was forty-two years of age.

DR. MACNAUGHTON JONES said he did not consider ascites to be always associated with malignancy, as he had drawn off ascitic fluid from a number of cases where there had been an ovarian cystoma, and the patient recovered.

DR. RANKEN LYLE read a paper on "A Series of Fifty Consecutive Abdominal Sections," which will be found fully reported on page 684 of present issue.

DR. HERMAN remarked that Dr. Lyle had obtained the best results in all the cases but one, the patient in that case having died from a disease which at present they could neither predict nor prevent. As to the question of aseptic precautions in cases of the kind, he (Dr. Herman) believed that the septic poison was neither inhaled nor swallowed, but was conveyed by contact alone, and that the particles which conveyed the poison were subject to the law of gravity and did not fly up to the operator's beard or hair. He believed that the only necessity was to make everything aseptic that touched the patient or the wound. As to the question of drainage, he thought that if there was an abscess cavity one should make some provision for the exit of the pus. In several cases of extra-uterine abscesses he had put gauze in the opening with the object of preventing union by first intention, and so provided for the escape of the fluid, and the results, as a rule had been satisfactory. One way by which Dr. Lyle secured aseptic conditions during operations on the abdomen was the fact that he allowed only those to assist him who had been trained under his own eyes. The results of Dr. Lyle's cases showed that he took all the effective and necessary precautions, those precautions at the same time being very simple in character.

DR. EDEN said he was very glad to hear the reader of the paper emphasise the importance of making a correct diagnosis before doing an abdominal operation. The art of diagnosis was being neglected now-a-days. A larger amount of time given to diagnosis would be an advantage to both the operator and the patient. As

to the use of gloves, he thought that rubber gloves were necessary to good work, especially in infective cases. Then, again, he always tried to manage his instruments himself, and even to thread his own needles, in order to reduce as far as possible the risks which must result from several persons handling them during operation. With regard to drainage, the more experience he had of abdominal sections the less reason he saw to drain. But he never found any harm arise from a gauze drain. He used a rubber tube through which he passed the gauze, and he always found this answer very well. He could not imagine how a piece of sterile gauze would cause abscess. He thought there was a risk of filling the peritoneal cavity with saline fluid, as the fluid might carry infective material into parts where the presence of organisms might lead to serious consequences.

Dr. ELDER considered the results unique, and were only possible after the work done by such men as Spencer Wells, Lawson Tait and others. In cases where sepsis followed operation, he thought it was owing to infective material which came from outside. As to the question of drainage, he thought very few of them would go as far as Dr. Lyle. Dr. Elder instanced a case of rupture of an ectopic gestation occurring at night in a collier's cottage, where the conditions were very unfavourable, and although he left the peritoneum full of blood without drainage the patient got perfectly well. He thought that gloves rather interfered with the delicacy of one's touch, but in cases of suppuration were necessary.

Dr. R. L. DICKINSON (New York) said he had been impressed by the great simplicity and the common-sense methods employed by Dr. Lyle. He thought that in America there was a danger in having too many assistants for the class of operations they were specially considering that night. They trained too many assistants; the training schools insisted on having as many nurses as possible in the operating room. But he preferred to do his own work himself, and to give assistants as little chance as possible for omissions in connection with antiseptic arrangements. Catgut was mostly used in America in cases of abdominal section. The use of gloves had become practically universal there. The percentage of cases of sepsis had slightly dropped, since the use of gloves. He thought that as they increased in surgical skill they made their incisions proportionally smaller. It was his practice to use the smallest possible incision. As to drainage, in America the custom was never to drain except for pus in the connective tissue.

Dr. MACNAUGHTON JONES, in congratulating Dr. Ranken Lyle on the result of his cases, said that the good of early operation was asepsis, thorough and complete. He was one of those who considered that no pains, no precautions, should be omitted to attain this end. He endorsed Dr. Lyle's practice of free flushing out of the abdomen with saline solution in all cases requiring it. The three most important post-operative signs were temperature, pulse, and bowel. He considered that the two former varied so much that it was more especially when taken into consideration with the correlated signs and symptoms that they came to be of great importance. Of the three, the bowel gave him the greatest anxiety. Sepsis occasionally occurred no matter what precautions were taken. Fritsch's *dictum* was aphoristically true—the patient did not die, because of sepsis, but became septic because he was dying.

Dr. RYALL said he could not understand how saline fluid poured into the abdomen could prevent adhesions. He believed adhesions could best be prevented by getting the bowels to open soon after an operation. He was a great believer in a tubular drain in preference to gauze. He was a believer in masks so that talking or spitting or whispering into a wound might be prevented. The shorter the operation the better for the patient.

The PRESIDENT said an incision should be made sufficiently large to admit of the removal of the tumour

without stretching and afford a good view of the pelvis. He always had the vagina thoroughly disinfected, as it might have to be opened during the course of the operation, but he did not think he could always tell exactly what the nature of any lump was that he might find in the abdomen without opening it. The great secret of success in all cases of abdominal section was covering the stump by peritoneum and the sutures should be catgut.

Dr. RANKEN LYLE, in reply, said he only employed two assistants at each operation, and not more than three or four other students could stand in the room at the time. He thought that the only cases which should be drained were cases of pelvic abscess. In other cases he thoroughly washed with saline fluid, flushed the abdominal cavity and closed the wound. The saline solution also stimulated circulation in the peritoneum, and secondly, enabled the phagocytes there to devour the micro-organisms more easily. He did not think that the use of gloves was necessary. During an operation possibly nobody talked more than he did, but he had never seen any ill effects. Occasionally caps and masks might be necessary. He did not think that disinfecting the vagina did much good, as in the large majority of cases the vagina was not septic. He always took great care to flush out the pelvis and wash away the pus.

CORRESPONDENCE.

FROM OUR SPECIAL CORRESPONDENTS ABROAD. FRANCE.

Paris, June 24th, 1906.

FORMIATE OF SODA.

ACCORDING to Dr. Rachon, formic acid enjoys very remarkable bactericidal properties as regards the pneumococci of pneumonia. To six patients, of whom three were children, he administered formiate of soda (6 to 10 grains for children, 30 to 40 for adults). Under the influence of this treatment the fever fell on the third or fourth day. At the same time he prescribed rum or brandy. He observed in each case a certain amount of diarrhoea and sweating. In the treatment of tonsillitis, due to pneumococci, he prescribed a gargle of formiate of soda (4-100) with equal success.

Subsequently he treated 65 cases of pneumonia by the same method with only one death, and that patient was a heavy drinker.

In infantile diarrhoea Dr. Rachon prescribes formiate of ethyl as follows:—

Formiate of ethyl	20 to 40 drops.
Syrup of catechu	1 oz.
Water	4 oz.

A tablespoonful every three hours.

In every case the diarrhoea ceased within two days.

But it was in acute enteritis and summer cholera that the most remarkable results were obtained. He prescribed the formiate of ethyl at the dose of 25 drops daily.

Formiate of ethyl	25 drops.
Syrup of catechu	2 drachms.
Water	1½ oz.

A teaspoonful every two hours.

It would appear from the above, says Dr. Huchard, that formic acid constitutes a remarkable antiseptic against the pneumococci, which are thereby arrested in their development *in vitro*.

VEGETATIONS OF THE GENITAL ORGANS.

Collodion	1 oz.
Resorcin	2 drachms.

Apply to the tumour after washing with Hoffmann's anodyne or ether. Two or three applications are sufficient.

It is reported that the invitation to be given to the British Medical Association to select Exeter for next year's meeting will be accepted. The only other place which is openly desirous of receiving this influential body is Bradford.

GERMANY.

Berlin, June 24th, 1906.

At the Society for Surgery, Hr. Fritz König, Altona, spoke on

TRAUMATIC OSTEOMATA.

He said that after an injury, sometimes after sharp pain and swelling of the soft parts, a tumour of the bone formed that gave the impression of a periosteal sarcoma. Several circumstances were, however, opposed to the assumption, as the form of the tumour, which was diffuse upwards, ended sharply below. Further the X-ray image was different and also the course of the affection. After some months the tumour ceased to grow, or even became smaller. The speaker saw this in a case last year. In another case, that of a woman, æt. 54, who had fallen through a window, and who had spinal paralysis as a result, death ultimately took place. In this case a swelling of the femur came on four weeks after the injury which at the autopsy proved to be a thickening of the periosteum with bony inclusions. The external covering of the bone was torn by the force of the injury, hæmorrhage took place and the growth of the periosteum had followed in consequence. Here as in other cases there was no proper traumatic osteoma, but a structureless callus, therefore a tissue process as in the recovery from a fracture. If such tumours were operated on early nothing was gained, on the contrary the condition was usually made worse and recurrences took place after the operation. One should decide to operate only when the symptoms were very severe, and only then when the development of the tumour had been watched three or four months. Then all the new growth should be removed.

Hr. V. Bramann, Halle, had seen a large number of such tumours. Frequently there was no connection with the bone, but in consequence of the injury a bony development had taken place in the muscles, or had developed from the bony pieces torn off. He had operated after six months to a year, after waiting to see if any retrogressive change would take place.

Hr. Staffel, Chemnitz, had seen such cases in brewers' draymen, who were in the habit of raising the barrels on to the thighs. These were cases of Wade's disease, that frequently led to operation, so that the employment could not be followed.

Hr. Höcker, Stettin, would make a strong distinction between the two processes described by König and v. Bramann. The latter-mentioned cases had long been known in the varieties of the "exercise" bones and "riding" bones; these always proceeded from the muscles.

Hr. Zeoge v. Manteuffel, Dorpat, remarked that hæmatomata might also ossify. This ossification in Virchow's opinion, proceeded from the cells of the periosteum that found their way into the hæmatoma.

At the Hufeland Society, Hr. Ewald showed a man æt. 57, of healthy parentage and who had never been seriously ill. In 1903 he had inflammation of the veins of the legs. Two years later he had extreme swelling of the tonsil and glands of the neck. Respiration and deglutition were impeded. The tonsils and adenoid growths were removed. A splenic tumour was felt. The sub-maxillary glands were the size of a hen's egg, glands could also be felt down to the clavicle. The inguinal and axillary region were free. The blood showed no morphological change, the hæmoglobin contents had fallen to 50 per cent. The white and red corpuscles were in normal proportion. He was treated by 120 sittings of X-rays and the condition improved, the hæmoglobin rising to 70 per cent. The improvement was only temporary, however. The end of March, 1906, he returned to the hospital. Since January he had difficulty in swallowing. He looked cachectic; in both axillæ were glands the size of walnuts, the right tonsil was enlarged, the laryngeal opening was surrounded by growths, and the sounds of stenosis were heard on inspiration. Lungs and heart normal, liver enlarged, spleen much hyper-

tropical. No albumen, no sugar. Hæmoglobin 50 per cent. Red blood corpuscles, 2,500,000, white 4,500. Poikilocytosis. Examination of the stomach showed no free hydrochloric acid. Liq. Fowleri 60, later on 70 drops daily for five weeks, after that 60 drops again. On April 20th, the difficulty of swallowing had disappeared, the tonsils were small, the growths no longer to be seen. On May 5th the patient felt so well that he left the hospital. When admitted he weighed 55½ kgm., he went up gradually to 57½ kgm, but fell away at the end of April to 56, and weighed only 54 when he left. It was a fact that this brilliant and striking improvement was due to the arsenical and Röntgen ray treatment, but it was to be feared that the present good condition was only a temporary one and that there could be no question of any absolute recovery.

AUSTRIA.

Vienna, June 24th, 1906.

TETANY AND STRUMIPRIVA.

At the "Gesellschaft für innere Medicin" Leischner showed an interesting case in connection with the thyroid gland. The patient is a male, æt. 40, who was operated on by Billroth, 1890, who removed both sides of the gland but left the isthmus.

Three days after the operation typical tetanic cramp commenced, recurring two or three times every week. Shortly after this the hair began to fall out, succeeded by a new growth; along with this the nails fell off, and have done this annually since the operation. Marital desire has fallen off, and he has an objection to all kinds of flesh meat.

In the course of time the isthmus or small portion of the gland that was left began to increase, with a corresponding diminution of the tetanic attacks; but recently the attacks have returned with more severity, as they are now accompanied with unconsciousness.

The treatment with thyroid gland gave no relief to the patient, but bathing and hydropathic management gave better results. Some time ago he suffered severely from pains in the legs followed by cataract in both eyes for which he was successfully operated on. It is evident from these phenomena that the epithelial bodies of the gland must either have been injured or removed in the operation.

HELMINTHIASIS.

Goldmann read a long article to the members on tænia in the alimentary canal. Helminthiasis he affirmed comprehended all the vermicular parasites of the alimentary canal which are of importance in practice from the injury they do the mucous membrane of the bowel and the convulsions produced in infancy. Trichocephalus Oxyuris, Ascaris, &c., not infrequently produce appendicitis. Trichocephalus and Ascaris have been frequently found in the gall ducts and peritoneal cavity with resulting abscesses.

Again, many of the Helminthiæ form toxins which sooner or later produce a hæmolytic condition with serious consequences, particularly trichocephalus, tænia, and ankylostomum, which are very fruitful in producing intractable anæmia.

The sovereign remedy has always been some form of Ext. Filicis maris, which itself is not without danger to the patient owing to the large doses necessary for the removal of the parasite. Six grammes has produced intoxication and even death in the more susceptible, while blindness is not at all an uncommon result. It may be stated at once that this drug is quite useless for the removal of ankylostoma, and to be of any use in other cases must be given in large doses up to ten grammes for an adult. Goldmann has now treated 1,200 for ankylostoma. In his early practice Ext. Filicis mar. was generally used for this, but failing so frequently made him try cortex, pumicæ, granulata, chloroform, santonin, and bitumen fagi, with varying results. In other directions he used ribes embelia myrsinacæ, etc., with better results as vermicides but these are not vermifuges and must be given in large doses of 40 grammes. Sebirol is one of these pepper drugs which is a good vermicide but no vermi-

fuge, but which combined with thymol and salicylate makes a formidable agent. This mixture may be given in oil or made into a pastille with chocolate. No hungering period is necessary; only a purgative the day before the drug is administered and light food the day following.

Schrotter said he had obtained good results from the use of cortex fibrillorum puniceæ granulatae, in an extract form. The bowel must be well emptied and a day's fasting before the drug is administered. Friedjung said he had got better results from extr. aspidii spinulosa.

Rick recommended the kernels of cucurbita maxima; 130 rubbed up with sugar and cacao in the case of children.

Goldmann said aspidium spinulosum had failed miserably in his hands, particularly in ankylostomiasis.

LETTERS TO THE EDITOR.

HYGIENIC MEASURES AGAINST SYPHILIS.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—Prof. Elie Metchnikoff, in his lecture on Wednesday, May 30th, at King's College, said:—

Since it has been shown to be possible to guard both our skin and our alimentary canal against the attacks of insects and entozoa containing the virus of disease, how then does it happen that man runs a greater risk of being infected by a virus existing in other men. Man is the principal source of contagion in tuberculosis, influenza, and many other diseases of the respiratory organs.

Man, again, carries about and communicates without intermediary the virus of venereal disease. Since, then, both the organ which furnishes and the one which receives the virus belong to the human race, and to beings provided with the power of sense and of reasoning, it might appear simple and easy to avoid all danger.

This is what I have always thought, ever since I discussed the question of the prevention of venereal diseases as the Secretary of the Harveian Society for the prevention of those maladies, which took place in 1867; and I have always felt astonished at the callous way in which all attempts to lessen the prevalence of these preventable pests have been hushed up by persons who know so little about the mortality caused thereby.

Prof. Metchnikoff truly remarked that "syphilis is one of the most important causes in shortening human life and in bringing about mortal diseases." To prove his point he cited an account given by Prof. Runberg, of Helsingfors, contained in the *Deutsch. Med. Woch.*, 1900, p. 297, concerning 734 deaths occurring in insured persons, 11 per cent. of whom had died of syphilitic disease of the heart, general paralysis, brain lesions, in all 84 deaths. He adds to these, cases of cerebral apoplexy in persons under the age of 50, and considers that syphilis caused about 15 per cent. of the deaths of all these insured lives. The lecturer opined that next to phthisis, syphilis is the most frequent cause of death.

I should think that, however true this may be for some European States, it cannot be true for the population of the United Kingdom, for here chronic alcoholism and phthisis are surely much more fatal causes of disease than syphilis, and I remarked at one of the Congresses on Venereal Diseases, held in Brussels, that Paris seemed to me very much more affected with syphilis than London, as far as I could judge by personal observation and by statistical accounts at my disposal.

I believe that the police system of Paris increases the spread of syphilis, because it tempts young people to run into danger, instead of suggesting early honest intimacies between the sexes. And, after thinking over the question for many years, I have come to the conclusion that we males should commence by inflicting some penalty upon our own enfranchised sex, instead of on unenfranchised women, when any of us communicates syphilis to another person.

Miss Harriet Martineau once truly said that if women obeyed any law, it was merely out of good nature, since they had no voice in the enactment of any law, and consequently it seems to me that to be just we should punish only men, and not women, when they infect their neighbours. Of course, as in the case of affiliation, the charge of contamination by the man would require to be clearly proved to the judge and jury.

Prof. Metchnikoff speaks slightly of early marriage as a preventive of syphilis; but any one who knows how free our native Indian soldiers are from this disease will understand that early marriage is certainly a very great preventive measure.

But, unfortunately, the early marriages of the Hindoos leads to starvation, and they therefore fall from Scylla to Charybdis. But early marriages in France, where families are so moderate in size (100 wives of Parisian medical men have only 150 children.—Dr. Luland), and even among our own West-end people early marriage might ward off syphilis and not entail poverty.

Prof. Metchnikoff has done great service in proposing injunction with calomel ointment in case of any suspected contagion occurring, and we all trust that this plan may be of great service.

I am, Sir, yours truly,

C. R. DRYSDALE, M.D.

London, June 24th, 1906.

OUR HOSPITALS.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—There is no doubt but that our whole hospital system will have to be reformed. Years ago, when there was no provision for the working classes for proper medical and surgical treatment, hospitals were supported financially, as a matter of principle, by those who did not belong to the working classes. Just as the system of education in this country during the last sixty years or so has changed, so the care of the sick poor has passed into other hands.

Hospitals are no longer restricted to the poor, but very many who would not have gone to hospitals in those days resort to them now; for the simple reason that it is impossible for them to get in their own homes the treatment they require. The reform that must be made in our hospitals is evidently that they must let the patients supply the funds required for their support, and not let them be treated as simple recipients of charity. Many, very many, who used to subscribe to hospitals in the past, now consider that they do enough in paying the rates and taxes for the support of the fever hospitals, asylums, infirmaries, and this class of institutions; and it is only those that have more than they want who can afford to be generous.

There is not the least doubt but that very serious injury has been done to the great body of general practitioners throughout the country by the opening of hospitals to those patients who used to pay the practitioners; and it would be well if the profession took this matter into consideration and used its influence in reform. Possibly and probably the want of funds will do more than anything; and a change will come when the public generally understand this question better.

I am, Sir, yours truly,

R. L.

INFANT MORTALITY AND PATENT MEDICINES.

To the Editor of THE MEDICAL PRESS AND CIRCULAR.

SIR,—There cannot be the least doubt about the murderous powers of baby-soothing medicines, to which you refer in your leader of June 20th; they constitute the determining lethal factor in a great number of cases. The fact, to which you are rightly giving prominence, that the advertisements of these cruel frauds find a place in most of the leading papers is astounding; it is impossible to believe the owners of newspapers can be fully alive to the truth; you are at any rate taking away any excuse for the future, not only with regard to this, but to the whole system of

quackery, and you are earning the gratitude of the public accordingly. Simple mothers and nurses reading frequent articles deploring the excessive infantile mortality cannot believe that the advertisements in the same papers recommending some "baby-soothing" nostrum with an attractive name can be pure deception. These drugs, in most instances, are given to "quiet" the child when it cries in pain from indigestion. If they have any potency it is in virtue of the narcotics or anodynes they contain. The baby's pain is mitigated, it sleeps; and the same process being repeated time after time, it either dies in the end from inanition or survives as a rickety cripple. In any case, instead of treatment of the cause—improper food and feeding, to which any medical man could at once direct himself—the symptom, pain, is alone dealt with, and, if mitigated, often with disastrous result. Cases of this kind used to be frequent only among the poor; that they are becoming more and more common in the homes of the well-to-do and the wealthy is, to some extent at least, traceable to the facts which you have exposed with respect to the powers for deceit conferred upon the quack medicine dealer by leading newspapers, which assume the function of guardian of the welfare of the people, and are so regarded by their less ingenuous readers.

I am, Sir, yours truly,
AN OBSCURE PRACTITIONER.

June 21st, 1906.

UNIVERSAL LEG SPLINT AND CRADLE COMBINED.

DR. CHEVERS of Manchester writes:—

This splint, as shown in sketch, consists of a white enamelled metal frame 32 inches in length, 7 inches in depth, and 9 inches wide. Along the top on each side is fixed a row of brass studs which serve to secure a series of 10 straps. These straps are each 3 inches wide and are button-holed or eyeletted so as to be adjustable to half an inch. They are made of pegamoid and may therefore be sterilised by boiling. The advantages claimed for the splint are as follow:—

It requires no padding, can be used for either leg, and is readily cleansed.

The swing arrangement of the straps when in position is more comfortable than a perfectly resistant surface.

By means of the adjustable straps it is adaptable to any size, shape, or length of limb, whether child or adult (even an amputation limb).

It is of the greatest convenience when heel pressure has to be relieved, which in case of either a short or long limb can be easily effected by removing the strap at the location of the heel, so that a space is left.

One of its greatest acquisitions is the elevation of the limb with steady graduated support to the whole under surface, which is attained by graduating the length of the straps on which the limb rests.

It is obvious also that by regulating the straps the splint can, if required, be used as a double inclined plane. One or more of the straps may be used over, instead of

under, the limb, so as to keep the limb or amputation stump fixed in case of a restless patient or child. If alternate straps are lowered nearly to the floor of the splint but not touching, so that the leg still swings, and the other ones buttoned perfectly tense across the top of the splint, the splint then acts as a perfect cradle, and all pressure of the bed clothes is removed. If any portion of the foot should project above the splint, an adjustable and detachable guard is provided to remove weight of clothes.

After the leg has been put up in fracture splints, it may then be placed in the universal splint and active motion thereby prevented.

When excessively wet dressings are required to be applied to the limb, such as evaporating lotions, they can be kept in place without the use of a bandage (which only absorbs the moisture and interferes with evaporation); and by the application instead of one or more of the non-porous pegamoid straps, and by placing a dressing tray within the splint under the suspended leg, it acts as a receptacle for the drippings from the moist dressings.

The placing of the straps over the limb very much facilitates the keeping of an ice bag in position, and they can be made use of for this purpose over any part of the limb, especially the knee in synovitis.

I have had frequent and various uses for the splint over a period of three years, and have found it of greatest service.

It is manufactured by Messrs. Jas. Woolley, Sons and Co., Ltd., surgical instrument makers, of Manchester.

THE NEW PRESIDENT OF THE ROYAL COLLEGE OF SURGEONS, IRELAND.

THE new President of the College of Surgeons is perhaps one of the most widely known of Irish surgeons on account of his world-wide reputation as an ophthalmologist. Mr. Swanzy received his medical qualifications from Trinity College, Dublin, in 1865, and in 1873 became a Fellow of the College of which he is now President. He holds the posts of Senior Surgeon to the Royal Victoria Eye and Ear Hospital, and of Ophthalmic Surgeon to the Adelaide Hospital.

He has also served as President of the Ophthalmological Society of the United Kingdom. His work on "Diseases of the Eye, and their Treatment" is universally known, and has passed into a ninth edition. Mr. Swanzy enters on his term of office as President of the Royal College with the complete respect and regard of his colleagues, and of the medical profession generally.

The new Vice-President of the College, Mr. John Lentaigne, F.R.C.S., is also a well-known surgeon, and holds the post of Surgeon to the Mater Misericordiae Hospital. Like his President, he is a graduate of Dublin University, and a most popular member of the medical profession.

THE NEW BENNETT MEDAL.

WE publish herewith pictures of the Bennett Medal which has been instituted by the old students of Prof. Bennett, of Dublin. The obverse is an excellent portrait of Mr. Bennett, while the reverse shows a representation of "Bennett's fracture." The designing is by Mr. Oliver Sheppard, R.H.A., and our readers are able to judge of its high artistic merits. We believe that subscribers can obtain replicas of the medal as mementoes at a moderate charge.

OBITUARY.

STANLEY MORSE, M.R.C.S., L.R.C.P.

WE much regret to notice the death by accident of Dr. Stanley Morse, second son of Mr. L. L. Morse, M.P. for South Wilts. He was educated at St. Bartholomew's Hospital, and qualified in 1905. Dr. Morse, who was 26 years of age, was senior house surgeon at the Metropolitan Hospital, Kingsland Road. A fortnight before his death he was conducting a *post-mortem* examination on a child who had died from some form of blood-poisoning, when he slightly pricked himself. Blood poisoning followed, and fatal complications developed. Dr. Morse had arranged to attend the wedding of his eldest sister at Swindon next week. This death adds another to the long list of medical men whose lives have been sacrificed at the altar of duty.

LIEUTENANT FORBES MANSON GRANT
TULLOCH, M.R.C.S., L.R.C.P.

LIEUTENANT FORBES MANSON GRANT TULLOCH, R.A.M.C., died on the 20th inst., at the Queen Alexandra Military Hospital, Millbank, aged 27. The youngest son of Surgeon-General Tulloch, of Eastbourne, he was born in 1879, and received his professional education at St. Mary's Hospital, whence he took the degree of Member of the Royal College of Surgeons, and Licentiate of the Royal College of Physicians, London, in 1901. He served in South Africa as a civil surgeon in 1902-3, and returning home was gazetted a lieutenant in the Royal Army Medical Corps from August 31, 1903. At the close of 1904 he was selected for special service in Uganda, and was sent out to Entebbe by the Colonial Office as a commissioner to inquire into the causes and prevention of sleeping sickness. In Uganda he unfortunately contracted the disease, and was invalided home, but the progress of the malady was very rapid, and on Wednesday it proved fatal.

Lunacy Administration in Ireland.

At the last meeting of the Medico-Psychological Association of Great Britain and Ireland, Dr. Dawson, Medical Superintendent of Farnham House Asylum, called attention to a matter of considerable importance to the resident medical officers of Irish asylums. He demonstrated to the Association how amongst other undesirable effects the newly-issued "Public Bodies Order" of the Local Government Board placed the medical officer in a subsidiary position to that of lay officers, and thereby interfered with the proper administration of the asylum. In consequence of Dr. Dawson's representation, the Association passed the following resolutions:—"That the Medico-Psychological Association of Great Britain and Ireland, having learned through reports in the public press of a movement in Ireland tending to lessen the authority of the resident medical officers of asylums, desires to express in the strongest manner its conviction that any such change would certainly result in injury to the patients, and would be in direct opposition to all progressive and enlightened treatment of the insane."

"That the resolution be delivered into the hands of the Right Hon. James Bryce, Chief Secretary to Ireland, the manner of such delivery being left to the discretion of the President of the Association."

We applaud the wisdom of the Association in ordering that the resolution be given "into the hands" of Mr. Bryce, as, if this course is followed, it will no longer be possible for him to plead in the House that "he has no knowledge of the circumstances."

Catholic University School of Medicine in Ireland.

THE following arrangements have been made in celebration of the fiftieth anniversary of the establishment of the above School of Medicine:—On Thursday, June 28th, there will be athletic sports at the newly acquired grounds, Croydon Park. On Friday, June 29th, there will be Solemn High Mass at the Catholic University Church, Stephen's Green, South, at 12 noon. His Grace Archbishop Walsh has expressed his intention of being present, and the Mass will be celebrated by the Very Rev. Mgr. Fitzpatrick. The sermon will be preached by the Rev. Dr. Cronin, F.R.U.I. The professors and students of the Medical School and of University College are expected to attend in academic costume, and will robe in University College at 11.30. At 8.30 p.m. on the same day, by kind permission of the Lord Mayor, a musical soiree and conversation will be held in the Mansion House. On Saturday, June 30, at 11.30 a.m., by kind invitation of the Very Rev. Dr. Mannix, President, there will be an excursion to Maynooth College, returning about 4.30 p.m. On the same evening (Saturday, 30th inst.), the anniversary banquet will take place at the Dolphin Hotel, at 7.30 p.m.

Past students are invited to participate in these celebrations, and as a considerable concourse is expected, applications for tickets (stating which functions it is proposed to attend) should be addressed to the Registrar, Prof. M'Loughlin, as soon as possible.

MEDICAL NEWS IN BRIEF.

Opening of the New Spa at Cheltenham.

TIME was when the mineral springs of Cheltenham were among the most renowned in Europe, attracting royalty and the aristocracy of Great Britain to the town with the strong backing of the leading physicians of the day. But the beautiful country surroundings got into the hands of financiers and speculative builders, who thought more of cutting up the land into building plots than of developing the attractions held out by the springs as a health resort. With the inauguration, however, of the new central spa last week, with its magnificent halls, pump room, etc., at a cost to the Corporation of £60,000, the foundation has been laid for a revival of the ancient popularity of Cheltenham, and we shall be greatly surprised if it does not shortly become a centre of attraction for the fashionable *habitués* of health resorts, and one to which the physician can again send such patients as would benefit by its waters, its health-giving and equable climate and the beauty of its surroundings. Nor has the social element been overlooked. As Dr. Armstrong, of Buxton, remarked at the opening ceremony, the new buildings would be dignified by the name of Kursaal by a less modest Corporation; and when we add that severe analytical tests prove the waters to be identical therapeutically to what they were "when George the Third was King," it will be understood that the new bid for public and professional consideration stands a very good chance of immediate recognition. We agree with Dr. Armstrong, who declared that if the Cheltenham springs were situated in Germany thousands of persons would be drinking them. Cheltenham certainly has a water unique in England, and it may be confidently predicted that if the local authorities of British spas bestir themselves the medical profession would frequently advise patients to take the cure at Cheltenham and other watering places at home, instead of journeying to foreign countries. Dr. Goodhart sounded the right note when he reminded those assembled at the opening that a very necessary adjunct to success was that hoteliers laid themselves out to act in conjunction with medical opinion as regards dietary.

Fatal Fall in a Hospital.

WE regret to record that Mr. Duke, one of the resident officers of University College Hospital, London, met with a terrible death last week. He went to the lift intending to descend to another part of the building. The lift was not at that floor at the time, and, through some mistake, he stepped into the shaft and fell into the basement, where he was discovered by an attendant dead.

Reassuring Tommy Atkins.

OUR contemporary, *The Scotsman*, reports an interview with Sir Frederick Treves, who remarked that he was not disposed to make any definite statement on the subject of the tinned meat scandals. He wished, however, most emphatically to state, with reference to certain assertions which have been published to the contrary, that the tinned meat supplied to the British Army by our military authorities is of the highest quality. "No man in the British Army should suffer from any tinned meat he has consumed," said Sir Frederick. "I am speaking in this matter from purely personal experience. I cannot say how much of the tinned meat consumed in the Army is derived from America, but it is really of little consequence. Whatever is eaten in the Army is so carefully supervised and tested by the authorities that the possibility of poisoned or deleterious materials being produced for consumption is practically nil."

The *Tribune* reports the results of an inspection by its own correspondent of the Armour Company's premises at Chicago, where the largest meat packing plant is in operation. So far as a superficial examination of the buildings and appliances could go, he says he found them in a remarkably clean condition. He

watched the processes of manufacture and the material used from the stage of living animal to the processes of canning and labelling for export. No deleterious substances are included, and the process is cleanly and inoffensive. There was no attempt to conceal any part of the process or any department.

Incorporated Medical Practitioners' Association.

THE annual meeting of the members of this Association was held in London at the Trocadero Restaurant, on the 14th inst., when Dr. A. Percy Allan, of Croydon, was elected President for the ensuing twelve months. After the meeting the members and friends dined together, Dr. Allan in the chair, who announced in reply to the toast, "Success to the Association," that the Council had resolved in regard to the forthcoming election of Direct Representatives to the General Medical Council to recommend the members to support the candidature of Mr. George Brown, one of the present representatives, and Mr. Joseph Smith, President of the Association of Members of the Royal College of Surgeons of England, who was a candidate at the last election. In the course of the evening, the retiring President, Dr. Rivers-Willson, presented a testimonial to Mr. G. Brown, consisting of an illuminated address and a cheque in recognition of his services to the Association as Hon. Secretary and Editor of the official journal. The address was as follows:—"This address is presented to Mr. Geo. Brown, M.R.C.S.Eng., L.S.A.Lond., Member of the General Medical Council of Medical Education and Registration, on his retirement from the post of Editor of the Official journal of the Association,

Fatal Inquisitiveness.

THE East Sussex Coroner inquired at Eastbourne, on the 18th inst., into the death of Richard Thomas Foard, æt. 16, a boy employed by Mr. Myers, a dentist. The boy was stated by his father to be of an inquiring disposition. His duty was to attend to the consulting room and to answer the door. Owing to his not returning home at the accustomed time a search was made and he was found dead, with the apparatus used for administering nitrous oxide gas affixed to his face. He was reclining on a couch, his head was buried in a cushion, and he was in such a position that it would be difficult for him to raise himself. Dr. W. Muir Smith stated that nitrous oxide was the most harmless of anaesthetics. Witness had no doubt that the boy died, not as the result of poisoning from the gas, but from asphyxiation, simply because he could not release his mouth in order to take fresh air. A verdict of accidental death was returned, and the jury added that no blame attached to Mr. Myers.

The Apothecaries' Hall, Ireland.

THE Freedom of the Worshipful Company of Apothecaries' Hall was conferred on Sir Christopher Nixon, M.D., and Professor D. J. Loffey, M.D., of the Medical Faculty of the Catholic University, at the Examination Room of the Apothecaries' Hall on Friday, June 22nd, at 4 o'clock. At the same time the degree of L.A.H. was granted *honoris causa* to these gentlemen. The Governor, Colonel Adyl Curran, M.D., J.P., F.R.C.S., presided, and gentlemen attending the function were expected to wear academic costumes.

Trinity College, Dublin.

THE following candidates have passed the Final Examination in Medicine:—Francis O'B. Ellison, Thomas J. Cobbe, Malcolm K. Acheson and Henry B. Leech, equal, Richard Connell and Langford V. Hunt, equal, John A. Hartley, Theodore C. Somerville, Michael P. Leahy, George S. Walton, William Hutcheson, Ernest C. Crawford, John du P. Langrishe, Ernest D. Caddell.

Diploma in Public Health.—The following have passed Part I.: Edward W. W. Cochrane, Charles H. Burtchaell, Henry Knaggs. The following have passed Part II.: Charles H. Burtchaell, Edward W. W. Cochrane.

WEEKLY SUMMARY OF THE MEDICAL JOURNALS.

ENGLISH AND FOREIGN.

Specially compiled for THE MEDICAL PRESS AND CIRCULAR.
RECENT SURGICAL LITERATURE.

Certain Injuries Commonly Associated with Displacement of the Head of the Humerus.—In the experience of R. Jones (*Brit. Med. Journ.*, June 16th, 1906) the commonest complication of fracture of the upper end of the humerus is dislocation of the shoulder. The order of frequency of fractures of the shoulder connected with dislocation is as follows:—(1) Fracture through the surgical neck. 2. Separation of the greater tuberosity. 3. Fracture through the anatomical neck embracing the tuberosities. 4. Fracture through the neck of the scapula embracing the coracoid. 5. Separation of the lesser tuberosity. 6. Fracture of the glenoid. 7. Separation of the glenoid, anatomical neck. 8. Separation of the anatomical neck of the humerus, not including the tuberosities. The etiology of the injury is not clear. Fracture may follow dislocation occasionally, but in the great majority of cases fracture and dislocation occur synchronously. The shoulder should be reduced at the earliest possible moment. Delay may seriously complicate the result, as an unreduced dislocation is often the forerunner of an ununited fracture. This combination is very serious. The head of the bone is so displaced and the ineffective callus so exuberant that the arm is not merely seriously restricted in movement, but painful pressure symptoms result. Immediate reduction may be very simple, very difficult, or quite impossible. The method which has proved most successful with the author is the forcible extension of the arm held vertically, with often very hard pushing upwards of the fragments. The surgeon should be urged to try any and every method to reduce the head rather than submit the patient to the very positive risk of operation. The only operative procedures to be recommended are excision of the head of the bone, and McBurney's operation for reduction by the open method. Having reduced the dislocation, the fracture of the humerus is of comparatively little moment. The patient is allowed to sit up as soon as possible, as this is the least harmful method of applying extension to the lower fragment. Perfect anatomical results are rarely obtained, but the practical results are usually good. The author strongly deprecates the wiring of fragments in fractures through the surgical neck. S.

Wound of Thoracic Duct; Ligature; Recovery.—Fullerton (*Brit. Med. Journ.*, June 16th, 1906) reports that while removing a large mass of tubercular glands from the left side of the neck, and extending down to the pleura, a sudden gush of opalescent fluid was seen to come from beneath the sterno-mastoid muscle. The fluid was found to issue from the open mouth of a vessel just in front of the scalenus anticus, about an inch above the inner end of the clavicle. The discharging vessel was ligatured with formalin catgut. The duct on the proximal side of the ligature immediately became distended, so as to form a flat, button-shaped swelling, tense and grey, about half an inch in diameter. This enlargement felt so tense that it seemed ready to burst, and great care was taken to prevent this. The distal end was found to be about an inch in length and extremely like a thin-walled vein. It divided near its termination into three smaller vessels, which opened separately at the junction of the internal jugular vein with the subclavian vein. No fluid issued from this end of the duct, but on passing a grooved director through it, and along one of the terminal branches into the innominate vein, blood flowed along the groove. On removing the director this bleeding ceased, showing the action of the valves of the duct. This end of the duct was also ligatured. The

skin wound was stitched and a glass drainage tube was inserted for forty-eight hours. On account of the risk of the rupture of the proximal end of the ligatured duct, the patient was kept on the lowest possible diet for a few days, and all unnecessary movements were interdicted. The patient made an uninterrupted recovery, without any swelling or sign of leakage from the duct. A blood-count eight days after operation showed very little deviation from the normal as regards the lymphocytes. S.

Very Early Conditions of Cancer of the Tongue.—Butlin (*Brit. Med. Journ.*, May 26th, 1906) describes seven cases in which he removed part of the tongue for what clinically appeared to be a precancerous condition. On microscopic examination (using a continuous series of sections) early cancer was found in each case. The author states: "Two years ago, before my eyes were opened by the work of the Imperial Cancer Research, I should have regarded five out of the seven as precancerous conditions, and I am now wondering whether there are really any conditions perceptible to human sight and feel which are precancerous in the sense in which I have been accustomed to employ the term." The forms under which the disease commenced in these seven cases are four in number, viz:—(1) A flat, very slightly raised, smooth, red, glazed plaque, feeling like a thin piece of gristle in the surface of the tongue, not thicker than a three-penny or sixpenny piece, and looking and feeling like a primary hard sore; (2) a white, warty growth, not ulcerated, and scarcely indurated at its base; (3) a slight thickening and hardening of an old leukoplakic area, rather distinguishable to feel than sight; (4) a nodular plaque, red, and commencing to ulcerate with drawing-in of the surrounding tissues. So far six of the seven patients remain well and free from recurrence of the disease. The glands were removed in five of the seven cases, and should be removed in every case. The author lost one patient from secondary affection of the glands, which did not make its appearance for more than three years after the successful removal of one of the smallest cancers of the border of the tongue he had ever seen. S.

The Etiology and Treatment of Oblique Inguinal Hernia.—Murray (*Brit. Med. Journ.*, June 16th, 1906) considers that all the evidence we possess is in favour of the view that the main factor in the causation of oblique inguinal hernia at all periods of life is the presence of a preformed sac, a patent funicular process, and that whether the bowel will or will not enter the funicular process depends primarily upon the size of the opening at the internal abdominal ring; and secondarily, upon the strength of muscles guarding it. As a general rule the only satisfactory way of treating a hernia is by means of operation, and other things being equal, the earlier in life the operation is performed the better. The essential point in the operation is to so completely obliterate the sac as to render the peritoneal surface at this level free from any dimpling or depression. In order to ensure this, the inguinal canal must be opened up and a ligature applied to the sac at the level of the internal abdominal ring. The divided aponeurosis of the external oblique is united by overlapping, for the inguinal canal is thus narrowed, lengthened, and its original obliquity restored. In elderly persons in whom the inguinal canal has for years been enormously stretched, recurrence after operation can only be prevented by the use of a truss or mechanical support of some kind. As patients of the labouring class are apt to discontinue wearing a truss owing to expense and inconvenience, the author has

adopted a plan which has so far been successful. A rubber pad 1 inch by 1½ inches in size, made of the best Para rubber, is used as an internal truss. The operation for the cure of hernia is conducted in the ordinary manner, the external oblique is divided and the neck of the sac is sewn as high up as possible. The pad is now placed in position. The cord and its vessels are threaded into the large hole by opening the slit extending from the upper part of the hole to the margin of the pad. The edges of the pad are then placed beneath the internal oblique and conjoined tendon on the one side, and Poupart's ligament on the other. It only remains to cover the pad and cord with the cremaster muscle and sew together by overlapping the divided fibres of the external oblique. The pad lies on the transversalis fascia, and is devised to fill a gap and afford additional support at a very weak spot in the abdominal wall. The author has used similarly a piece of gauze in femoral hernia to plug the femoral canal. S.

On Some of the Diseases and Injuries of the Eye Peculiar to Children.—S. Stephenson (*Brit. Journ. of Child. Diseases*, 1905), in the course of his lecture, referred to the following:—By application of forceps, clumsy digital examination or prolonged labour due to deformed or narrow pelvis, the infants are liable to *corneal injuries* of more or less serious nature. Drs. Thomson and Buchanan observed a considerable number of cases in Glasgow where deformed pelvises are fairly common. They noted two forms of corneal injury: (1) a diffuse temporary opacity, and (2) a permanent linear opacity, generally multiple. The first is the commoner, and is due to oedema. The second is due to a rupture of the posterior elastic lamina with subsequent formation of fibrous tissue. The majority of the cases have been observed where the forceps have been applied, but it is not to be concluded that the forceps is the direct cause of the injury, as cases have been observed where there was bilateral oedema of the cornea. It is important to recognise that the narrow pelvis and delay which necessitated application of the instruments may be just as likely to cause the condition. There is no doubt about the permanency of these injuries, for Stephenson had a case of his own under observation where the scar tissue produced considerable irregular astigmatism and consequent bad sight. *Retinal hæmorrhages* are also liable to occur. They have been estimated at 10 per cent. to 32 per cent. after normal labours. They are not to be seen, as a rule, by the ophthalmoscope, as they usually occur in the periphery of the fundus. It is supposed that the extravasations result from disturbance of the retinal circulation due to compression of the central blood vessels of the optic nerve by cerebro-spinal fluid under high pressure. Wehrli has suggested that in a majority of cases the exciting cause of glioma of the retina is to be found in retinal hæmorrhage sustained at birth. M.

Primary Malignant Disease of the Vermiform Appendix.—H. D. Rolleston (*Lancet*, June 2nd, 1906), has been able to collect 62 examples of primary malignant disease of the vermiform appendix. The diagnosis was confirmed by the microscope, in 42 cases; of these 37 proved to be carcinoma, three were endotheliomata, and two were sarcoma. The age at which the disease was found varied from 12 years to 81 years in only 12 per cent. of all the cases were secondary growths present. It is not possible to form a definite picture, typical of this disease from the clinical histories of these cases, some were operated on for other troubles, the condition only being discovered when the abdomen was opened—in the majority of the patients the symptoms were those of appendicitis, in one form or another, and may be separated into four groups—1, symptoms of the first acute attack; 2, chronic symptoms with an acute attack; 3, recurrent attacks; and 4, symptoms of chronic appendicitis. The results of operation on this condition, both immediate and remote have been surprisingly good, there were four deaths within two weeks of the operation, two within

a few months, while of the remainder, in only one case is any recurrence of the disease recorded, some of the patients being now free from the disease for years. G.

Carcinoma of the Penis.—Crette (*Deutsche Med. Woch.*, June) describes the case of a child aged two years, who was admitted to hospital with a history of persistent priapism of 8 days' duration. There was a penile tumour, which had previously given rise to no symptoms. The penis and corpora cavernosa were extirpated, it was then found that the latter were completely and uniformly filled with hard masses of tumour, of a whitish grey colour; in the perineal region the two corpora cavernosa and the corpus spongiosum were bound together by the tumour, and formed a solid mass the size of a walnut. The tumour proved to be a large celled carcinoma, the cells being arranged partly in tubes, and partly in wide, solid cords; its starting point could not be determined with certainty. G.

Tuberculosis of the Kidney.—Henry Morton in a paper (*New York Med. Journ.*, May 26th) discusses fully the pathology and diagnosis of this condition, he then considers the various means by which a diagnosis may be arrived at, as to the condition of each kidney, by means of cryoscopy, and the catheterisation of the ureters. The author has in such cases carried out the following treatment, with a large measure of success; when both kidneys are tuberculous or one is tuberculous and the other disorganised from Bright's, or an amyloid degeneration, the treatment can only be directed to the palliation of the symptoms, and consists in forced nutrition, irrigation of the bladder, urotropine with narcotics, to relieve the pain. In cases where pyonephrosis forms, and the patient suffers from severe pain and sepsis, a nephrotomy should be done, since if the kidney is not opened and drained, death will occur. If the other kidney is diseased complete extirpation is manifestly impossible, nephrotomy is undertaken merely as a palliative measure; the wound should be allowed to granulate up—usually a permanent fistula remains, but the patient's life will be prolonged. When one kidney alone is affected, it is better at once to remove completely the diseased organ; even a moderate bladder, or lung tuberculosis is not a contradiction for operation; the bladder heals, or at least improves, when the source from which the tuberculous material is poured into it, is removed. It has been the practice in past years to await a spontaneous healing of renal tuberculosis and while this sometimes takes place, it is so unusual that it cannot be depended upon, as in most cases that are left, the disease extends to the other kidney, and to other organs. Perinephritic abscess forming, as a result of tuberculosis of the kidney, calls for immediate surgical treatment, the pus evacuated by a free incision and the diseased organ removed, if the second kidney is healthy. G.

The Cause of Punctiform Hæmorrhages in the Appendix.—Prof. C. Bayer remarks on the comparative frequency, of this condition (*Centralblatt Chirurgie*, April 28th.) of punctiform hæmorrhages in the mucous membrane of the appendix, found in those cases, where the organ has been removed during the interval between attacks. He does not agree with the view of this condition, which is held by many surgeons, that these small hæmorrhages are due to the compression of the appendix by instruments, used during its removal. Recently Prof. Bayer in operating on a case of appendicitis, took great precautions that the organ should not be in any way injured, yet on opening it the punctiform hæmorrhages were present—he believes that they are due to the mesentery being ligatured, and so blocking the veins before all the arterial blood is cut off from the appendix, the rule being to ligature the mesentery first, and attack the appendix afterwards. G.

NOTE.—A summary will appear each week in the following sequence—(1) "Recent Medical Literature." (2) "Recent Surgical Literature." (3) "Recent Gynaecological and Obstetrical Literature." (4) "The Recent Literature of Physiology and Pathology."

NOTICES TO CORRESPONDENTS, &c.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *Distinctive Signature or Initial*, to avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

REPRINTS.—Reprints of articles appearing in this journal can be had at a reduced rate, providing authors give notice to the Publisher or Printer before the type has been distributed. This should be done when returning proofs.

A THOUGHT FOR THE BACTERIOLOGIST.

How often have I asked in vain
Can the microscopist explain?
How men who swallow pounds of dust
(As at their daily work they must)
Often appear the most robust!

Surely if all we're told were true
Be dust (so bad for me and you),
And if the dustmen only knew,
They then should number very few,
Instead of thousands as they do.

The only reason I can think
Is possibly what dustmen drink!
Which, acting as a germicide,
Keeps some alive, who should have died,
Or, making deadly microbes "tight,"
Assist the wandering Leucocyte!!!

—A. D.

ROYAL METEOROLOGICAL SOCIETY, PLEASE NOTE.

"Dr." BODIE, the "bloodless surgeon" of the music-halls, was recently fined £3 for an assault on a stage patient.

"Dr." Walford Bodie, the defendant, said he was a doctor of medicine and master in surgery in the United States.

His Honour.—What State?

Witness.—Chicago.

His Honour.—What does F.R.M.S. mean?

Witness.—Fellow of the Royal Meteorological Society.

ANTHRAX FROM HORSEHAIR.

Dr. Legge's report on the "Incidence of Anthrax in the Manipulation of Horsehair and Bristles" shows that in the seven years 1899-1905 there were 77 cases, with 18 deaths.

A WARNING.

THE attention of medical men may be drawn to the following announcement from the *South Wales Daily News*:—"In connection with the present dispute at Ammanford the workmen's committee, which consists of about twenty members, propose holding a mass meeting at an early date. A medical man from the Rhondda Valley is expected to attend.

PHYSICAL TEST FOR EMPLOYMENT.

THE importance of the following new departure to the medical profession is obvious:—One of the largest armour and gun manufacturing firms in the East-end of Sheffield has decided that all applicants for work will in future be required to submit to a medical examination by the company's doctor. The regulation is arousing strong opposition on the part of employees. The various unions fear they will have to support those rejected as physically unfit, and already a protest has been entered, backed up by fifteen of the most important branches of the engineering trade.

Meetings of the Societies, Lectures, &c.

WEDNESDAY, JUNE 27th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. H. L. Barnard: Clinique. (Surgical). 5.15 p.m. Lecture.—Mr. A. W. M. Robson: The Surgical Treatment of Cancer of the Stomach.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. F. Taylor: Medicine. 3.15 p.m. Mr. M. Robson: Surgery. 4 p.m. Mr. Cargill: Ophthalmology. Out-patient Demonstrations.—10 a.m. Surgical and Medical. 11 a.m. Eye.

THURSDAY, JUNE 28th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Mr. Hutchinson: Clinique. (Surgical). 5.15 p.m. Lecture.—Dr. Langdon Brown: Purin Bodies and the Purinometer.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. G. Rankin: Medicine. 3.15 p.m. Sir W. Bennett: Surgery. 4 p.m. Mr. M. Davidson: Radiography. Out-patient Demonstrations.—10 a.m. Surgical and Medical. 12 noon. Ear and Throat.

FRIDAY, JUNE 29th.

MEDICAL GRADUATES' COLLEGE AND POLYCLINIC (22 Chancery Street, W.C.).—4 p.m. Dr. J. Horne: Clinique. (Throat).

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Dr. R. Bradford: Medicine. 3.15 p.m. Mr. McGavin: Surgery. Out-patient Demonstrations.—10 a.m. Surgical and Medical. 12 noon. Skin.

SATURDAY, JUNE 30th.

LONDON SCHOOL OF CLINICAL MEDICINE (Dreadnought Hospital, Greenwich).—2.30 p.m. Operations. Out-patient Demonstrations.—10 a.m. Surgical and Medical. 11 a.m. Eye.

Vacancies.

County Borough of Belfast.—Purdysburn Fever Hospital.—Resident Medical Officer. Salary £150 per annum. Applications to Saml Black, Town Clerk, Town Hall, Belfast.

County Borough of Belfast.—Purdysburn Fever Hospital.—Hoos Physician. Salary £125 per annum. Applications to Saml Black, Town Clerk, Town Hall, Belfast.

County Borough of Belfast.—Purdysburn Fever Hospital.—Matron Superintendent. Salary £100 per annum, with residence, board, and laundry. Applications to Saml Black, Town Clerk, Town Hall, Belfast.

Cambridgeshire, &c., Asylum.—Senior Assistant Medical Officer. Salary £150 per annum, with board, lodging, and attendance. Applications to T. Musgrave Francis, Clerk to the Visitors.

Devon County Asylum.—Third Assistant Medical Officer. Salary £140 per annum, with board, lodging, washing, and attendance. Applications to Medical Superintendent, County Asylum, Exminster.

Egyptian Government.—Ministry of Education.—Professor of Midwifery and Gynaecology. Salary £400 a year, with private practice. Applications to the Director, School of Medicine, Cairo, Egypt.

Egyptian Government.—Ministry of Education.—Medical Tutor and Registrar to Kasr-El-Ainy Hospital. Salary £400 a year. Applications to the Director, School of Medicine, Cairo, Egypt.

London Open-Air Sanatorium, Pinewood, Wokingham, Berks.—Assistant Medical Officer. Salary £100 per annum and all found. Applications to the Medical Superintendent.

Ramsgate General Hospital and the Ramsgate and St. Lawrence Dispensary.—Resident Medical Officer. Salary £100 per annum, with furnished apartments, board, and attendance. Applications to H. W. Thornton, Secretary, Dispensary, Broad Street, Ramsgate.

St. Bartholomew's Hospital and College.—Demonstrator of Chemistry. Salary £150 per annum. Applications to T. W. Shore, Dean.

St. Bartholomew's Hospital and College.—Demonstrator of Physics. Salary £150 per annum. Applications to T. W. Shore, Dean.

Victoria Hospital, Burnley.—Resident Medical Officer. Salary £100 per annum, with residence, board, and washing. Applications to F. A. Hargreaves, Hon. Secretary, 7, Grimshaw Street, Burnley.

Appointments.

BELL, R. H., M.R.C.S., L.R.C.P.Lond., Physician to the Out-patient Department at the British Lying-in Hospital.

BIET, T. D., L.R.C.P. and S.Edin., L.F.P.S.Glasg., Medical Officer of District B by the Thrapston Board of Guardians.

BROWLEE, ALEX., F.R.C.S.Edin., Honorary Anaesthetist to the Cardiff Infirmary.

GROSVENOR, E. L., F.R.C.P.Lond., M.R.C.S., Certifying Surgeon under the Factory and Workshop Act for the Chelsea District of the County of London.

HEATE, A. DOUGLAS, M.D.Lond., M.R.O.P.Lond., Dermatologist to the General Hospital, Birmingham.

LUCAS, GROFFREY, B.A.Cantab., L.S.A., Medical Officer of Health to the Ringwood Rural District Council.

PHILLIPS, HUBERT C., M.R.C.S.Eng., M. and L.S.A., Medical Officer to the South District of Paddington.

PHILLIPS, JOHN, M.D.Cantab., F.R.C.P.Lond., Consulting Physician to the British Lying-in Hospital.

PRATT, JOHN W., L.R.C.P.Edin., M.R.C.S., Deputy Medical Officer for the Badstock District by the Clutton (Somerset) Board of Guardians.

SHAW, W. VERNON, M.B., B.S.Oxon., Medical Officer to the Malton Workhouse, York.

SPENCER, A. F., M.B., B.S.Edin., Certifying Surgeon under the Factory and Workshop Act for the Kinghorn District of the county of Fife.

THOMPSON, R., M.D.Durb., M.R.C.S., L.R.C.P.Lond., Assistant Surgeon to the Eye, Ear, and Throat Department of the Brisbane Hospital, Queensland, Australia.

Births.

BARKER.—On June 20th, at Edendale, Finchley, the wife of Chesman Barker, M.B.Lond., M.R.C.S., L.R.C.P., of a daughter.

FURNIVAL.—On June 15th, at Wykeham, Shas Road, Acton, the wife of Captain C. Hilton Furnival, R.A.M.C., of a son.

SERPELL.—On June 18th, at 2, Cross Park, Plymouth, the wife of H. Hamilton Serpell, L.R.C.P., M.R.C.S., of Polyphant, Lewannick, Launceston, Cornwall, of a son.

Marriages.

BAILLIE-WETHERALL.—On June 14th, at the Parish Church, Warborough, Oxon., Robert Alexander Baillie, M.R.O.S., L.R.C.P., of Kent House, Lordship Lane, London, youngest son of the late Robert Baillie, M.Inst.C.E., of Blackheath, to Mary Maltravers, youngest daughter of the late Rev. Thomas Manle Wetherall, M.A., T.O.D., Stoken-Felham, Herts.

HUNT-DUTTON.—On June 20th, at Hensfield Parish Church, Ernest Rivax Hunt, M.A., M.D., Cantab., of 19 Dyke Road, Hove, Sussex, to Margery Mary, second daughter of the Revd. W. T. Dutton, Vicar of Sidesham, Sussex.

PARTRIDGE-FORBES.—On June 20th, at the Parish Church, Mickleham, Surrey, Lionel Strowd Partridge, B.A., M.B.C.S., L.R.C.P., of Warminster, to E. M. (Lily), only daughter of Wm. Forbes, of Cass, Giglio, Alassio, and formerly of Smyrna.

Deaths.

DUKES.—On June 19th, at University College Hospital, London, by accident, Lawrence Duke, M.A., M.B., B.Ch., Cantab., third son of Clement Dukes, of Rugby, aged 25.

KELAART.—On June 20th, at Esher, Elizabeth, widow of Edward Frederick Kelaart, M.D.Edin., F.L.S., F.G.S., Army Medical Staff, in her 82nd year.

TULLOCH.—On June 20th, at the Queen Alexandra Military Hospital, Millbank, Forbes Manson Grant Tulloch, R.A.M.C., aged 27, youngest son of the late Surgeon-General Tulloch, of Balmoon, Eastbourne.
